

## Introduction

STM32CubeProgrammer (STM32CubeProg) provides an all-in-one software tool to program STM32 devices in any environment: multi-OS, graphical user interface or command line interface, support for a large choice of connections (JTAG, SWD, USB, UART, SPI, CAN, I2C), with manual operation or automation through scripting.

This document details the hardware and software environment prerequisites, as well as the available STM32CubeProgrammer software features.

# 1 Getting started

This section describes the requirements and procedures to install the STM32CubeProgrammer software tool.

STM32CubeProgrammer supports STM32 32-bit MCUs based on Arm®(a) Cortex®-M processors and STM32 32-bit MPUs based on Arm® Cortex®-A processors.

## 1.1 System requirements

Supported operating systems and architectures:

- Linux® 64-bit
- Windows® 7/8/10 32-bit and 64-bit
- macOS® (minimum version OS X® Yosemite)

There is no need to install any Java™ SE Run Time Environment since version 2.6.0. The STM32CubeProgrammer runs with a bundled JRE available within the downloaded package and no longer with the one installed on your machine.

Note:

*The bundled JRE is Liberia 8.0.265.*

For macOS software minimum requirements are

- Xcode® must be installed on macOS computers
- both Xcode® and Rosetta® must be installed on macOS computers embedding Apple® M1 processor

The minimal supported screen resolution is 1024x768.

## 1.2 Installing STM32CubeProgrammer

This section describes the requirements and the procedure for the use of the STM32CubeProgrammer software. The setup also offers optional installation of the “STM32 trusted package creator” tool, used to create secure firmware files for secure firmware install and update. For more information, check *STM32 Trusted Package Creator tool software description* (UM2238), available on [www.st.com](http://www.st.com).

### 1.2.1 Linux install

If you are using a USB port to connect to the STM32 device, install the libusb1.0 package by typing the following command:

```
sudo apt-get install libusb-1.0.0-dev
```

To use ST-LINK probe or USB DFU to connect to a target, copy the rules files located under *Driver/rules* folder in */etc/udev/rules.d/* on Ubuntu ("sudo cp \*.\* /etc/udev/rules.d").

Note:

*libusb1.0.12 version or higher is required to run STM32CubeProgrammer.*

a. Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

To install the STM32CubeProgrammer tool, download and extract the zip package on your Linux machine from STM32CubeProg-Linux part number on the website and execute *SetupSTM32CubeProgrammer-vx.y.z.linux*, which guides you through the installation process. In Ubuntu 20 STM32CubeProgrammer icon is not enabled by default. To enable it right click on the icon and choose “Allow launching”.

### 1.2.2 Windows install

To install the STM32CubeProgrammer tool, download and extract the zip package from STM32CubeProg-Win-32bits or STM32CubeProg-Win-64bits for, respectively, Windows 32 bits and Windows 64 bits, and execute *SetupSTM32CubeProgrammer-vx.y.z.exe*, which guides you through the installation process.

### 1.2.3 macOS install

To install the STM32CubeProgrammer tool, download and extract the zip package from STM32CubeProg-Mac part number on the website and execute *SetupSTM32CubeProgrammer-vx.y.z.app*, which guides you through the installation process.

*Note:* If the installation fails, launch it in CLI mode using the command

```
./SetupSTM32CubeProgrammer-
x.y.z.app/Contents/MacOs/SetupSTM32CubeProgrammer-x_y_z_macos.
```

Make sure you have administrator rights, then double-click *SetupSTM32CubeProgrammer-macos* application file to launch the installation wizard.

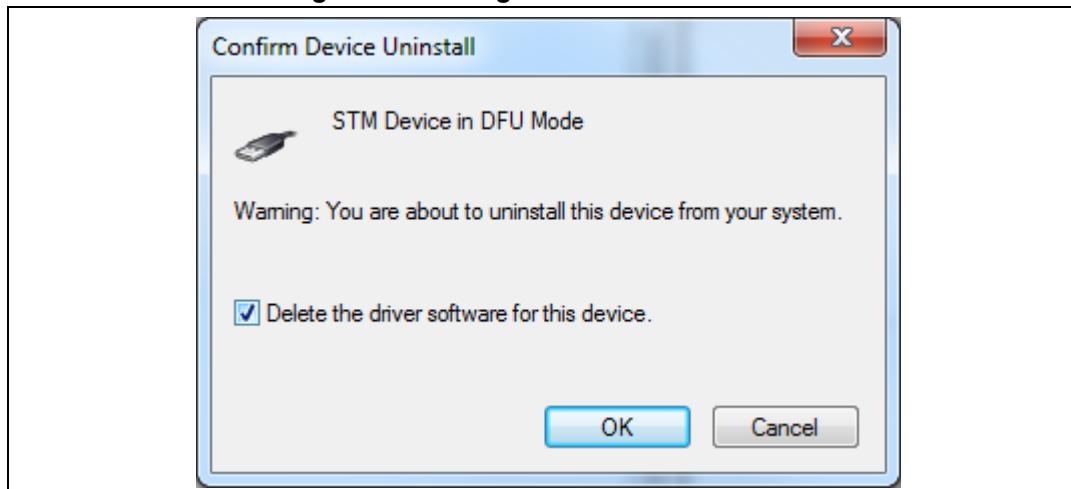

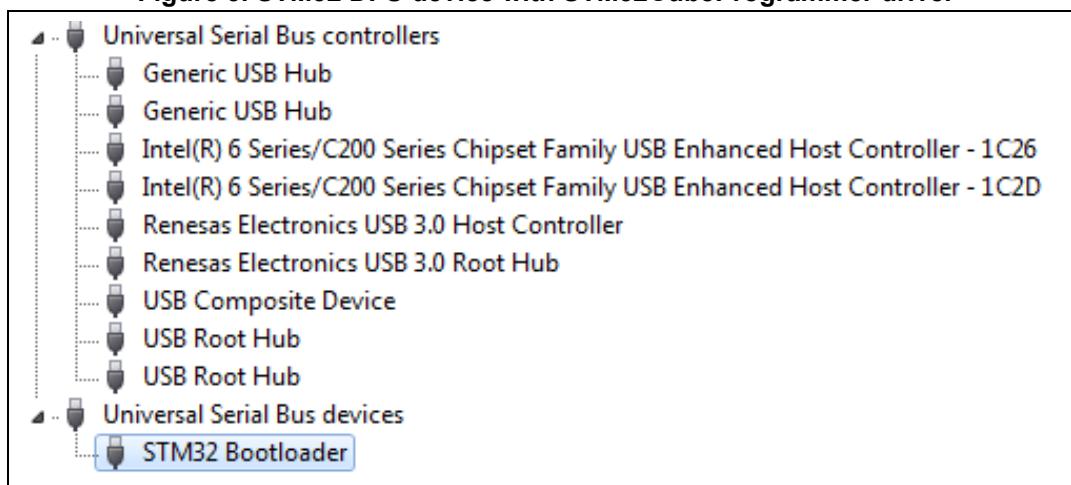

In case of error, try one of the following fixes:

- `$sudo xattr -cr ~/SetupSTM32CubeProgrammer-macos.app`
- launch the .exe file with the command  
`sudo java -jar SetupSTM32CubeProgrammer-2.7.0.exe.`

### 1.2.4 DFU driver

If you are using the STM32 device in USB DFU mode, install the STM32CubeProgrammer’s DFU driver by running the “*STM32 Bootloader.bat*” file. This driver is provided with the release package, it can be found in the DFU driver folder.

*If you have the DFUSE driver installed on your machine, first uninstall it, then reboot the machine and run the previously mentioned “.bat” file. You must check the ‘Delete the driver software for this device’ option to avoid reinstalling the old driver when, later, a board is plugged in.*

**Figure 1. Deleting the old driver software****Figure 2. STM32 DFU device with DfuSe driver****Figure 3. STM32 DFU device with STM32CubeProgrammer driver****Note:**

When using USB DFU interface or STLink interface on a Windows 7 PC, ensure that all the drivers of the USB 3.0 controller drivers are updated. Older versions of the drivers may have bugs that prevent access or cause connection problems with USB devices.

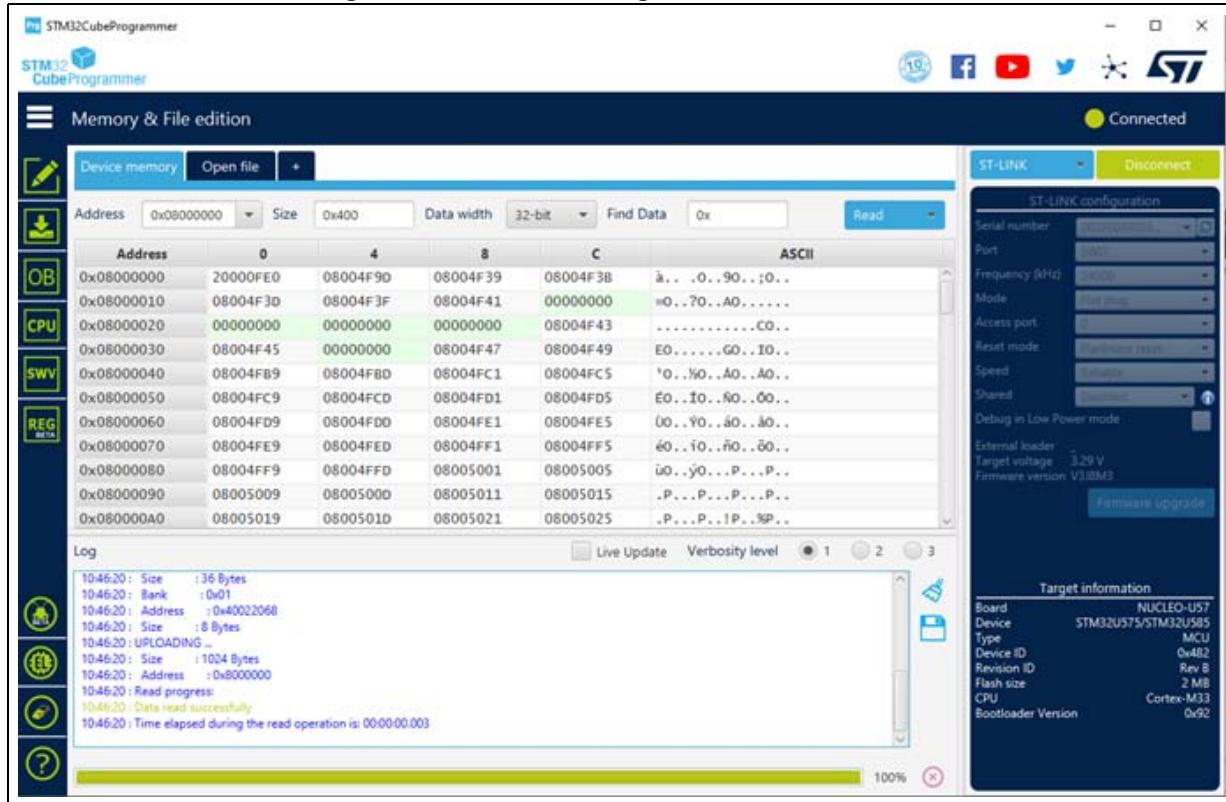

### 1.2.5 ST-LINK driver

To connect to an STM32 device through a debug interface using ST-LINK/V2, ST-LINKV2-1 or ST-LINK-V3, install the ST-LINK driver by running the “*stlink\_winusb\_install.bat*” file. This driver is provided with the release package, it can be found under the “*Driver/stsw-link009\_v3*” folder.

## 2 STM32CubeProgrammer user interface for MCUs

### 2.1 Main window

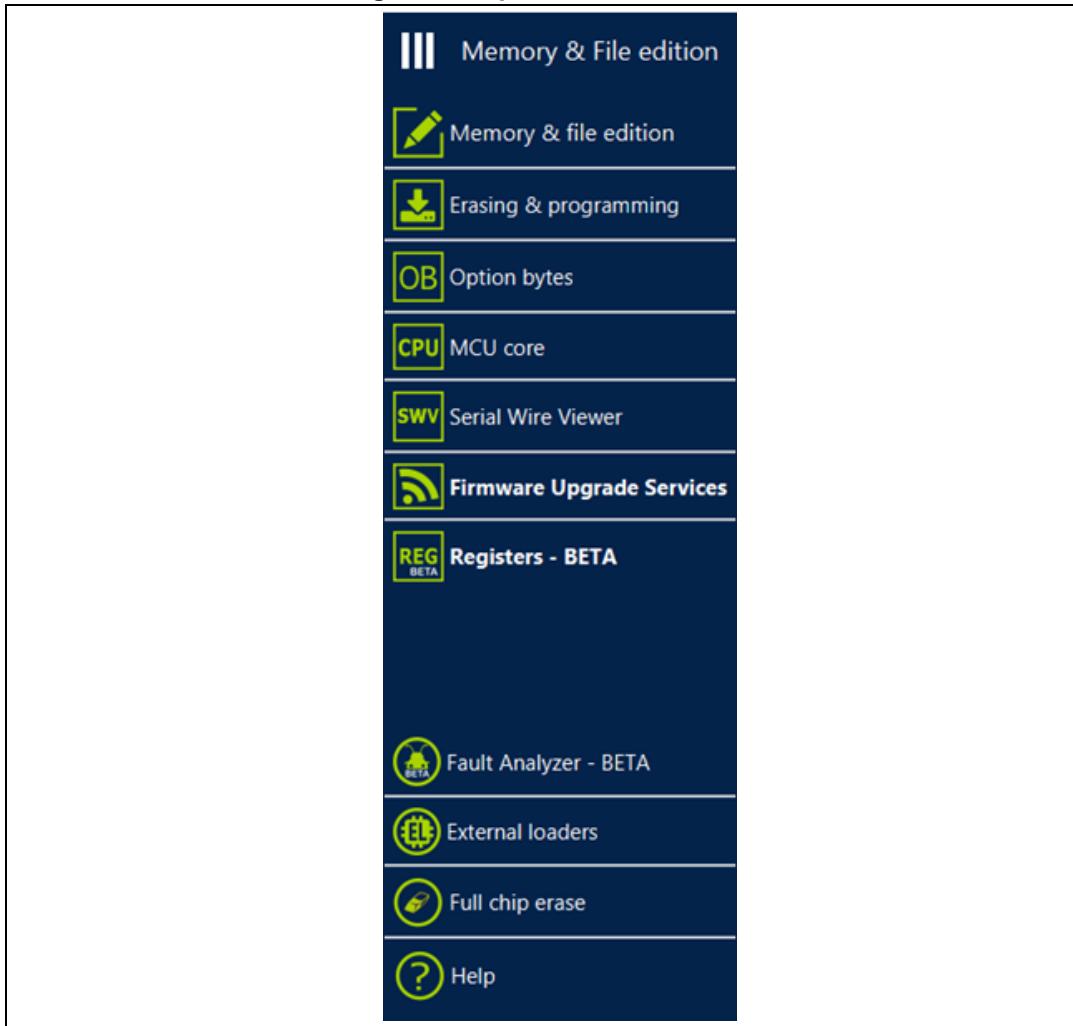

Figure 4. STM32CubeProgrammer main window

The main window is composed of the parts described in the following sections.

#### 2.1.1 Main menu

The Main menu allows the user to switch between the three main panels of the Memory and file edition, Memory programming and erasing, and Option bytes tools. The other panels will be displayed basing on the used device. By clicking on the Hamburger menu (the three-line button) on the top left corner, the menu expands and displays the textual description shown in [Figure 5](#).

**Figure 5. Expanded main menu**

### 2.1.2 Log panel

Displays errors, warnings, and informational events related to the operations executed by the tool. The verbosity of the displayed messages can be refined using the verbosity radio buttons above the log text zone. The minimum verbosity level is 1, and the maximum is 3, in which all transactions via the selected interface are logged. All displayed messages are time stamped with the format "hh:mm:ss:ms" where "hh" is for hours, "mm" for minutes, "ss" for seconds and "ms" for milliseconds (in three digits).

On the right of the log panel there are two buttons, the first to clean the log, and the second to save it to a log file.

### 2.1.3 Progress bar

The progress bar visualizes the progress of any operation or transaction done by the tool (e.g. Read, Write, Erase). You can abort any ongoing operation by clicking on the 'Stop' button in front of the progress bar.

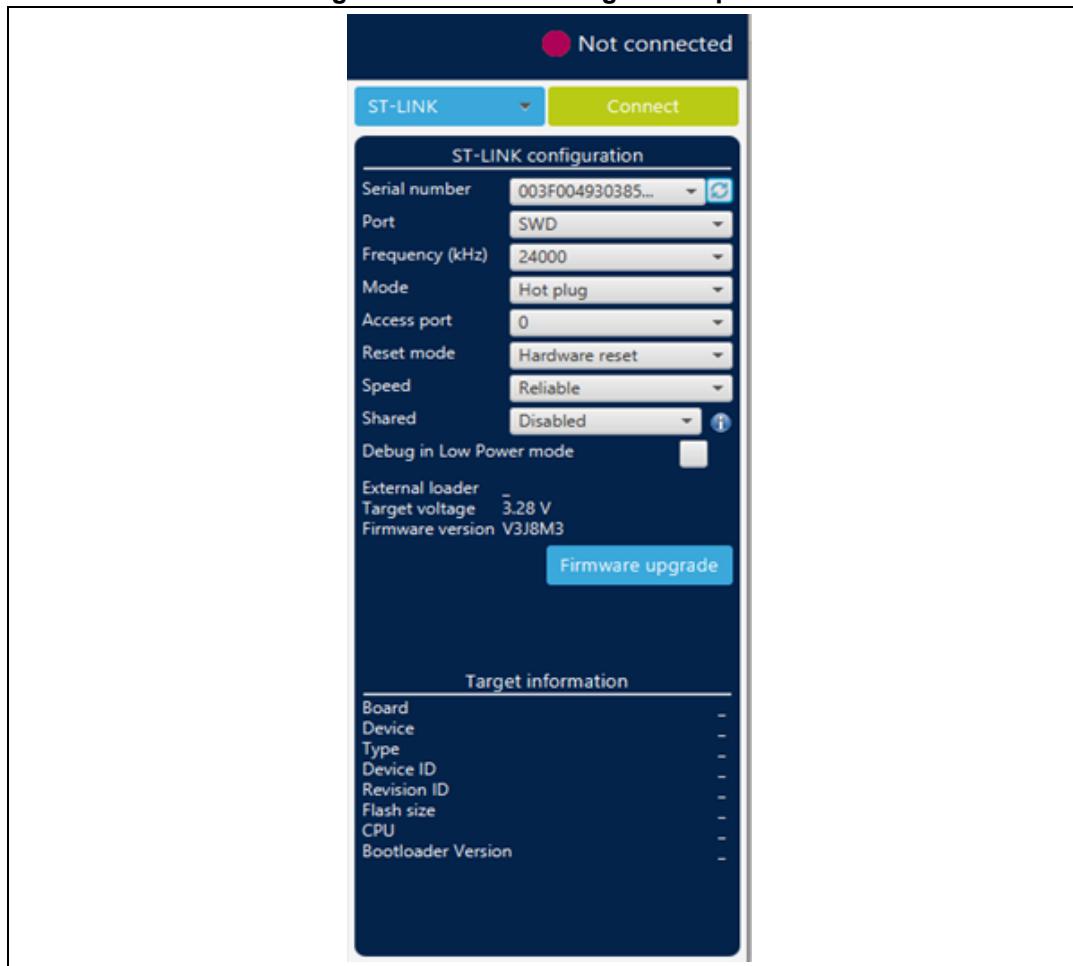

## 2.1.4 Target configuration panel

This is the first panel to look at before connecting to a target. It allows the user to select the target interface; either the debug interface using ST-LINK debug probe or the bootloader interface over UART, USB, SPI, CAN or I2C.

The refresh button allows you to check the available interfaces connected to the PC. When this button is pressed while the ST-LINK interface is selected, the tool checks the connected ST-LINK probes and lists them in the Serial numbers combo box. If the UART interface is selected, it checks the available com ports of the PC, and lists them in the Port combo box. If the USB interface is selected, it checks the USB devices in DFU mode connected to the PC and lists them also in the Port combo box. Each interface has its own settings, to be set before connection.

### ST-LINK settings

Figure 6. ST-LINK configuration panel

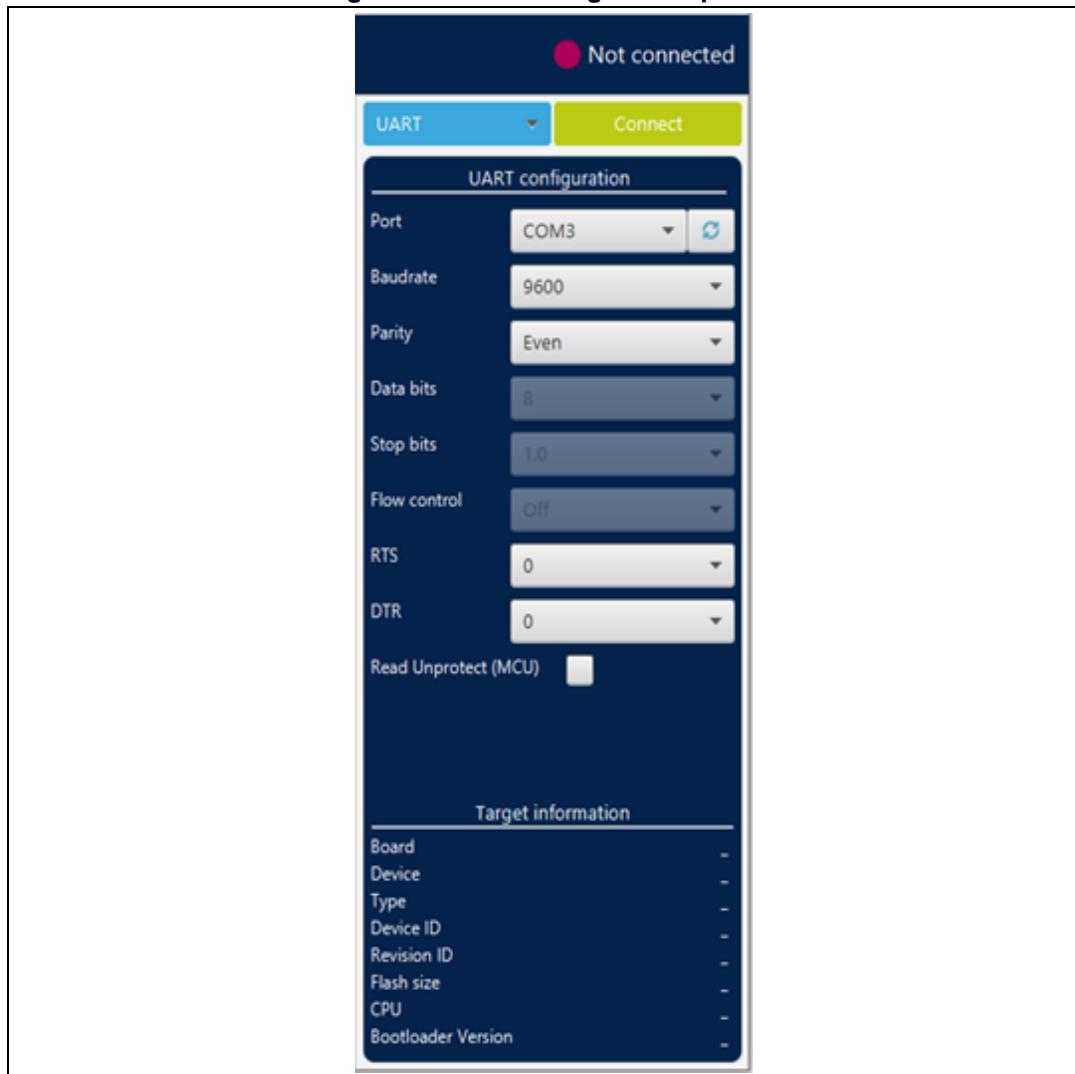

- **Serial number:** This field contains the serial numbers of all connected ST-LINK probes. The user can choose one of them, based on its serial number.
- **Port:** ST-LINK probe supports two debug protocols, JTAG and SWD.

- Note:** JTAG is not available on all embedded ST-LINK in the STM32 Nucleo or Discovery boards.
- **Frequency:** The JTAG or SWD clock frequency
  - **Access port:** Selects the access port to connect to. Most of the STM32 devices have only one access port, which is Access port 0.
  - **Mode:**
    - **Normal:** With ‘Normal’ connection mode, the target is reset then halted. The type of reset is selected using the ‘Reset Mode’ option.
    - **Connect Under Reset:** This mode enables connection to the target using a reset vector catch before executing any instructions. This is useful in many cases, for example when the target contains a code that disables the JTAG/SWD pins.
    - **Hot plug:** Enables connection to the target without a halt or reset. This is useful for updating the RAM addresses or the IP registers while the application is running.
  - **Reset mode:**
    - **Software system reset:** Resets all STM32 components except the Debug via the Cortex-M application interrupt and reset control register (AIRCR).
    - **Hardware reset:** Resets the STM32 device via the nRST pin. The RESET pin of the JTAG connector (pin 15) must be connected to the device reset pin.
    - **Core reset:** Resets only the core Cortex-M via the AIRCR.
  - **Speed** (Cortex- M33 only):
    - **Reliable:** allows the user to connect with a slow mode.
    - **Fast:** allows the user to connect with a fast mode.
  - **Shared:** Enables shared mode allowing connection of two or more instances of STM32CubeProgrammer or other debugger to the same ST-LINK probe.
  - **Debug in Low Power mode** (STM32U5/WB/L4 Series only): Set the bits in DBGMCU\_CR to 1.
  - **External loader:** Displays the name of the external memory loader selected in the “External loaders” panel accessible from the main menu (Hamburger menu).
  - **Target voltage:** The target voltage is measured and displayed here.
  - **Firmware version:** Displays the ST-LINK firmware version. The Firmware upgrade button allows you to upgrade the ST-LINK firmware.

## UART settings

Figure 7. UART configuration panel

- **Port:** Selects the com port to which the target STM32 is connected. Use the refresh button to recheck the available com port on the PC.

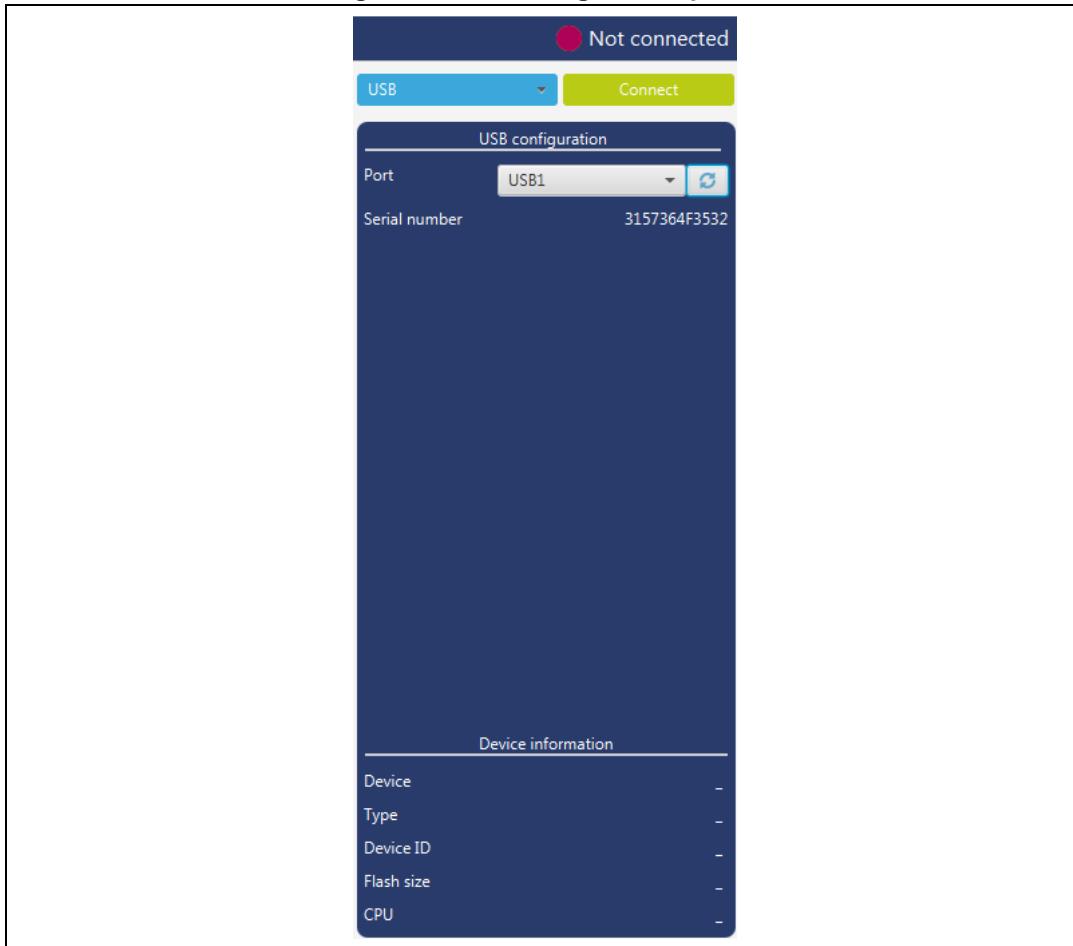

*Note:*

*The STM32 must boot in bootloader mode using boot pins and/or the option bits. Check “STM32 microcontroller system memory boot mode” (AN2606), available on [www.st.com](http://www.st.com), for more information on the STM32 bootloader.*

- **Baudrate:** Selects the UART baud rate.
- **Parity:** Selects the parity (even, odd, none). Must be ‘even’ for all STM32 devices.
- **Data bits:** Must be always 8. Only 8-bit data is supported by the STM32.
- **Stop bits:** Must be always 1. Only 1-bit stop bit is supported by the STM32.
- **Flow control:** Must be always off
- **RTS (Request To Send):** Sets the COM RTS pin to either high or low level.
- **DTR (Data Terminal Ready):** Sets the COM DTR pin to either high or low level.

## USB settings

Figure 8. USB configuration panel

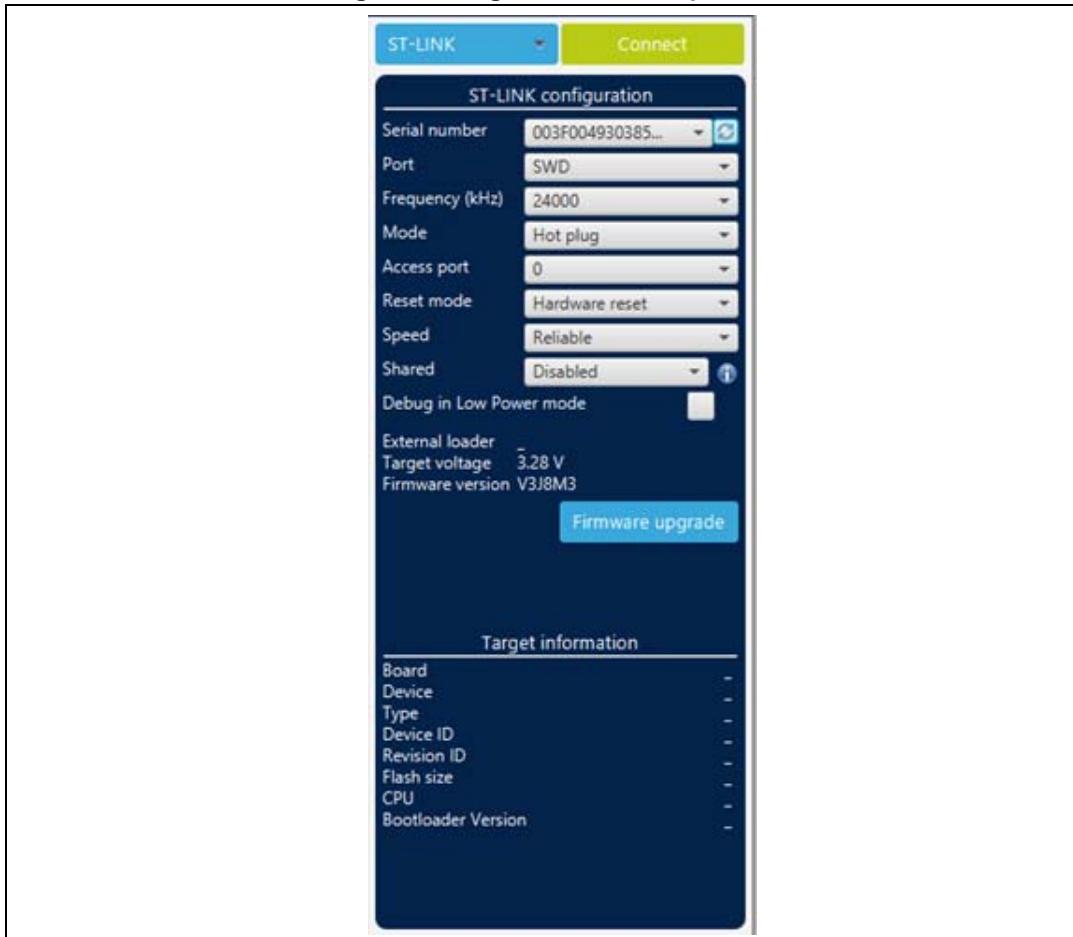

- **Port:** Selects the USB devices in DFU mode connected to the PC. You can use the refresh button to recheck the available devices.

*Note:* The STM32 must boot in bootloader mode using boot pins and/or the option bits. Check AN2606, available on [www.st.com](http://www.st.com), for more information on the STM32 bootloader.

Once the correct interface settings are set, click on the 'Connect' button to connect to the target interface. If the connection succeeds, it is shown in the indicator above the button, which turns to green.

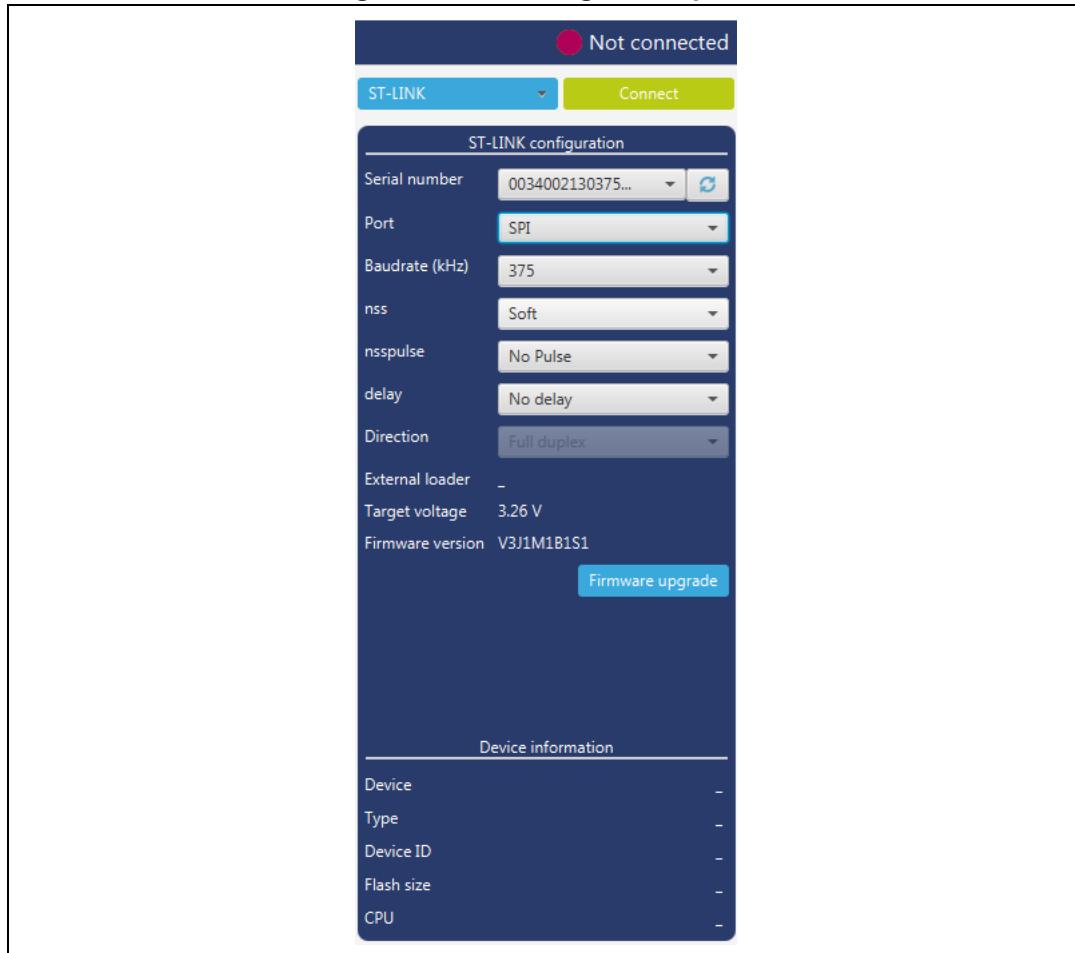

Once connected, the target information is displayed in the device information section below the settings section, which is then disabled as in [Figure 9](#).

Figure 9. Target information panel

## SPI settings

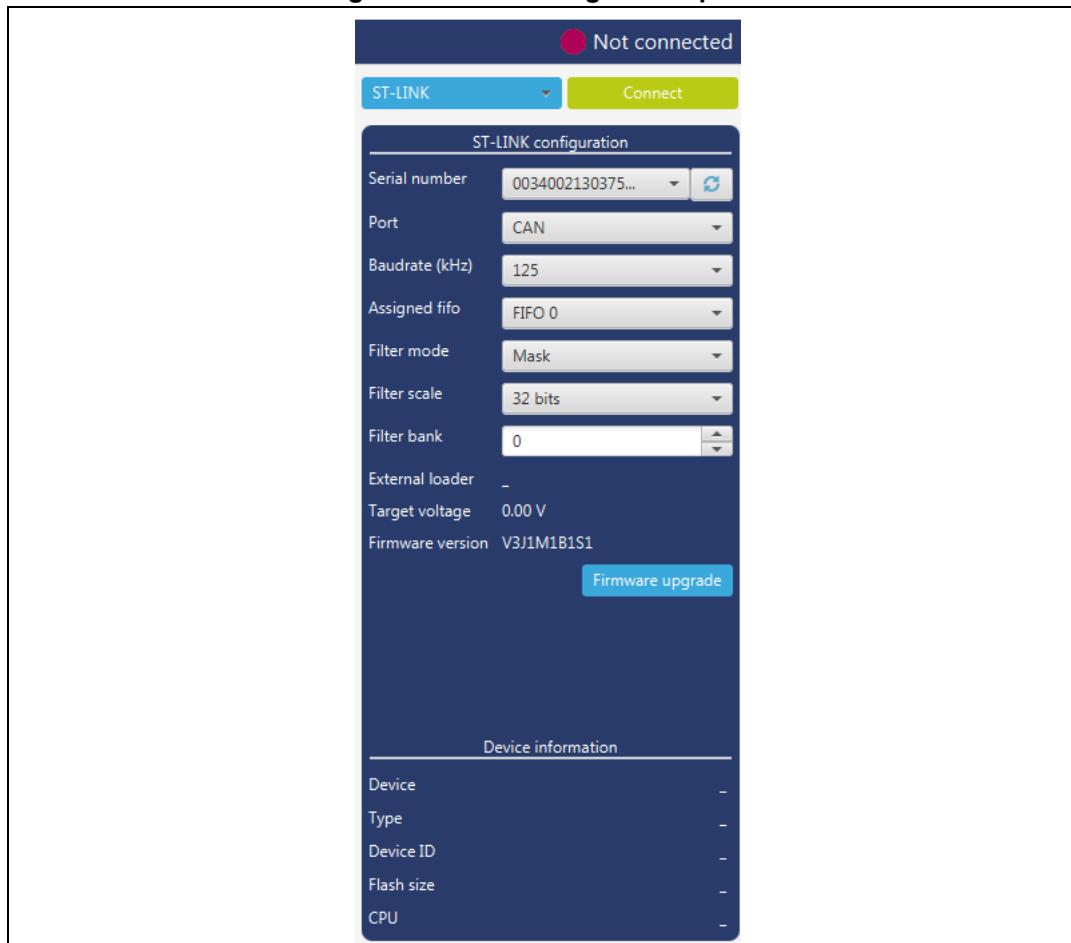

Figure 10. SPI configuration panel

- **Serial number:** This field contains the serial numbers of all connected ST-LINK-V3 probes in case of use of SPI bootloader.
- **Port:** Selects the SPI devices connected to the PC. You can use the refresh button to recheck the available devices.
- **Baudrate:** Selects the SPI baud rate.
- **nss:** Slave Select software or hardware.
- **nsspulse:** the Slave Selection signal can operate in a pulse mode where the master generates pulses on nss output signal between data frames for a duration of one SPI clock period when there is a continuous transfer period.
- **Delay:** used to insert a delay of several microseconds between data.
- **Direction:** Must be always Full-duplex, both data lines are used and synchronous data flows in both directions.

## CAN settings

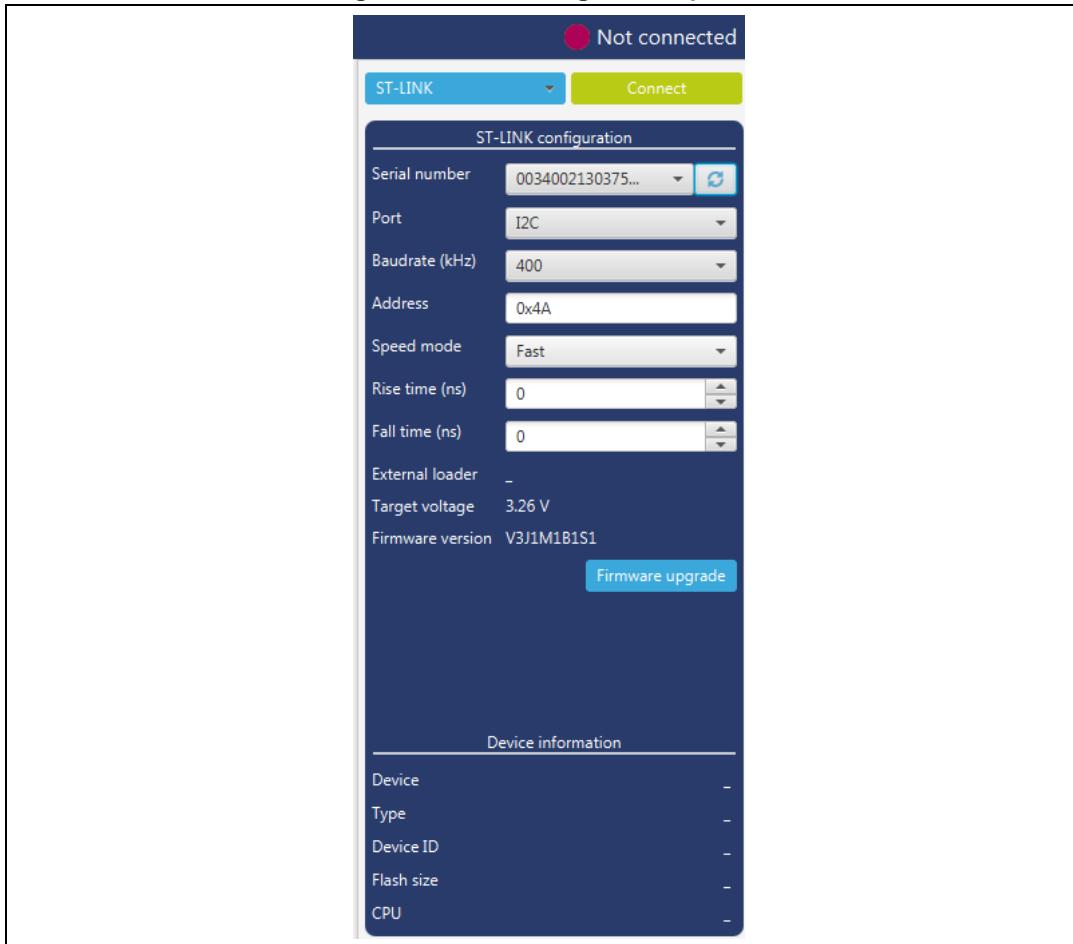

Figure 11. CAN configuration panel

- **Serial number:** This field contains the serial numbers of all connected ST-LINK-V3 probes in case to use CAN bootloader.
- **Port:** Selects the CAN devices connected to the PC. You can use the refresh button to recheck the available devices.
- **Baudrate:** Selects the CAN baud rate.
- **Assigned FIFO:** Selects the receive FIFO memory to store incoming messages.
- **Filter mode:** Selects the type of the filter, MASK or LIST.
- **Filter scale:** Selects the width of the filter bank, 16 or 32 bits.
- **Filter bank:** Values between 0 and 13, to choose the filter bank number.

## I2C settings

Figure 12. I2C configuration panel

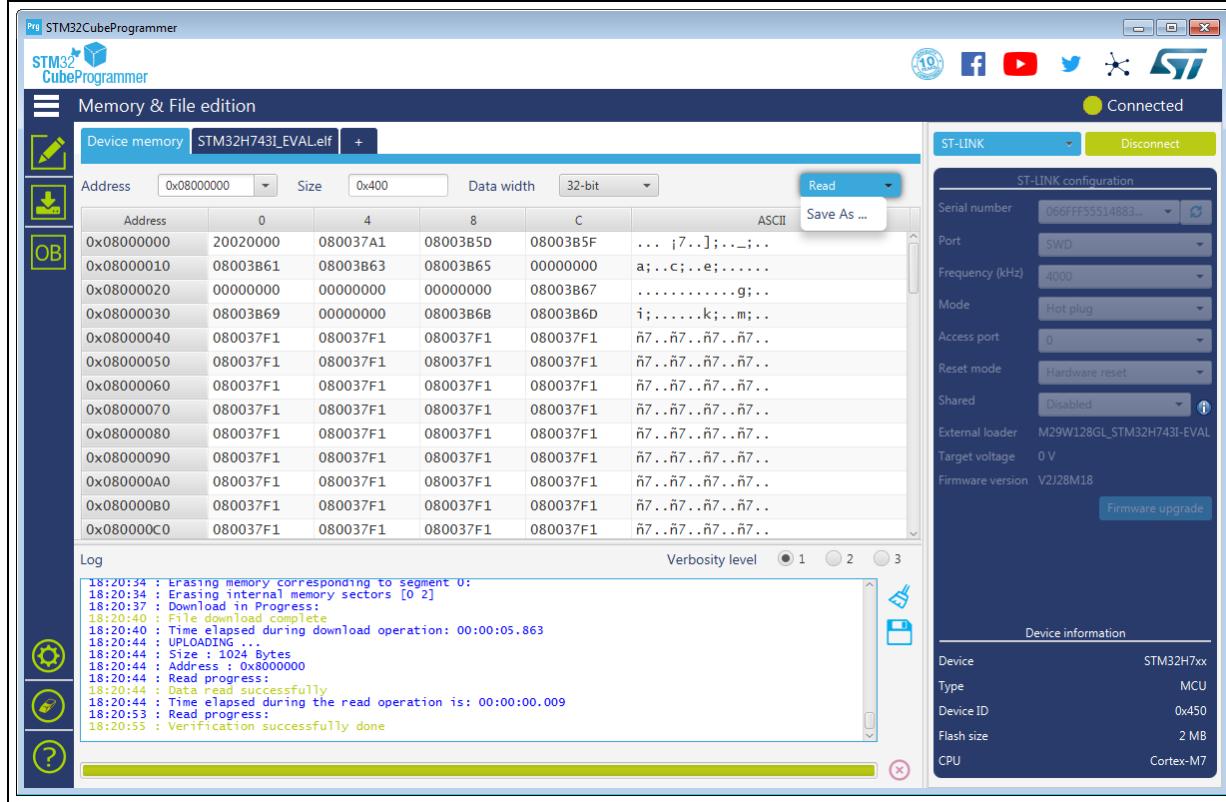

- **Serial number:** This field contains the serial numbers of all connected ST-LINK-V3 probes in case to use I2C bootloader.
- **Port:** Selects the I2C devices connected to the PC. You can use the refresh button to recheck the available devices.
- **Baudrate:** Selects the I2C baud rate.
- **Address:** Adds the address of the slave bootloader in hex format.
- **Speed mode:** Selects the speed mode of the transmission Standard or Fast.
- **Rise time:** Chooses values according to Speed mode, 0-1000 (STANDARD), 0-300 (FAST).
- **Fall time:** Chooses values according to Speed mode, 0-300 (STANDARD), 0-300 (FAST).

## 2.2 Memory and file edition

The Memory and file edition panel allows the user to read and display target memory and file contents.

### 2.2.1 Reading and displaying target memory

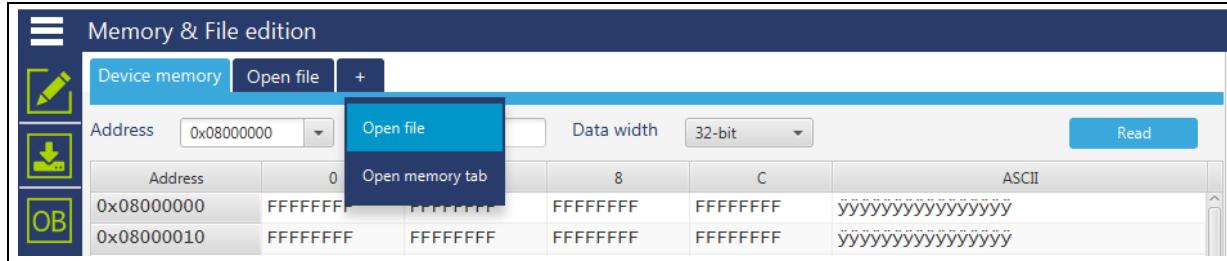

Figure 13. Memory and file edition: Device memory tab

After target connection, you can read the STM32 target memory using this panel. To do this, specify the address and the size of the data to be read, then click on the Read button in the top-left corner. Data can be displayed in different formats (8-, 16- and 32-bit) using the ‘Data width’ combo box.

You can also save the device memory content in .bin, .hex or .srec file using the “Save As...” menu from the tab contextual menu or the action button.

You can open multiple device memory tabs to display different locations of the target memory. To do this, just click on the “+” tab to display a contextual menu that allows you to add a new “Device memory” tab, or to open a file and display it in a “File” tab:

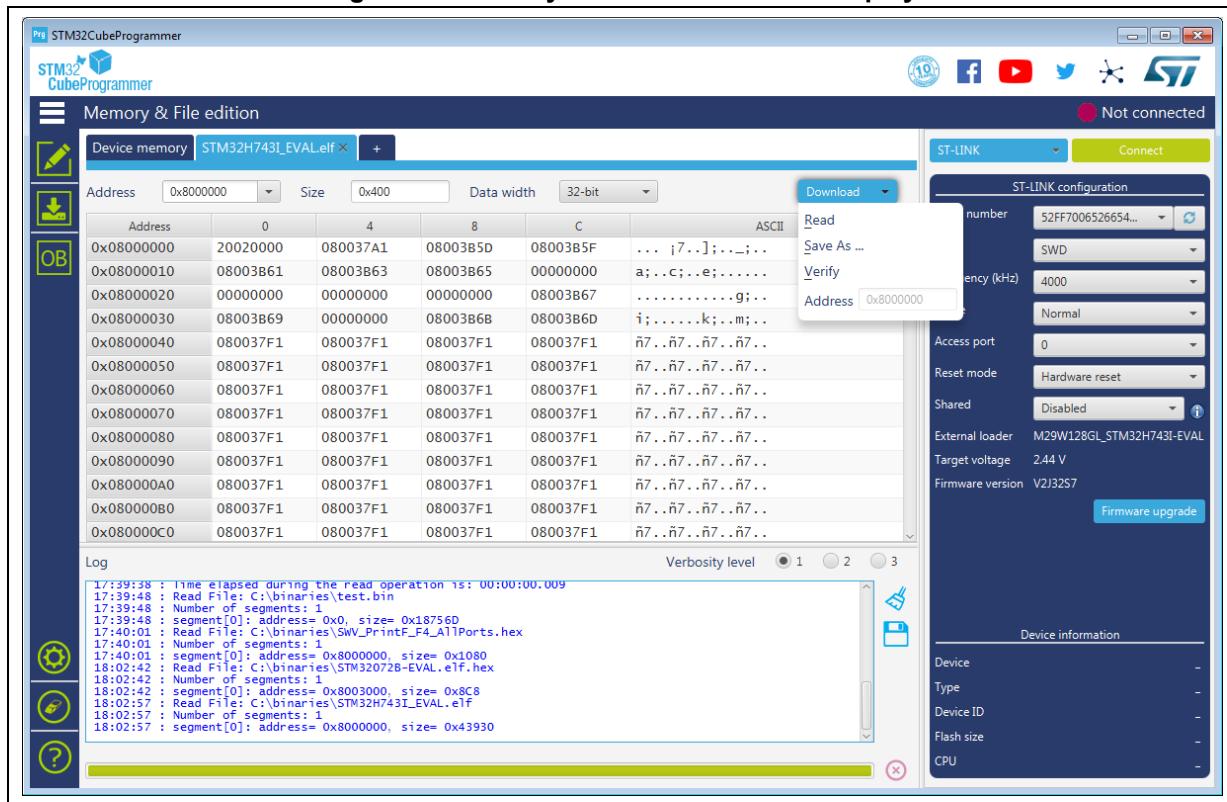

**Figure 14. Memory and file edition: Contextual menu**

## 2.2.2 Reading and displaying a file

To open and display a file, just click on the “+” and select ‘Open File’ menu, as illustrated in [Figure 14](#).

The file formats supported are binary files (.bin), ELF files (.elf, .axf, .out), Intel hex files (.hex) and Motorola S-record files (.Srec).

Once the file is opened and parsed, it is displayed in a dedicated tab with its name, as illustrated in [Figure 15](#). The file size is displayed in the ‘Size’ field, and the start address of hex, srec or ELF files, is displayed in the ‘Address’ field, for a binary file it is 0.

**Figure 15. Memory and file edition: File display**

The address field can be modified to display the file content starting from an offset. Using the tab contextual menu or the action button, you can download the file using “Download” button/menu. For a binary file you need to specify the download address in the “Address” menu. The user can verify if the file is already downloaded using the “Verify” menu, and also save it in another format (.bin, .hex or .srec).

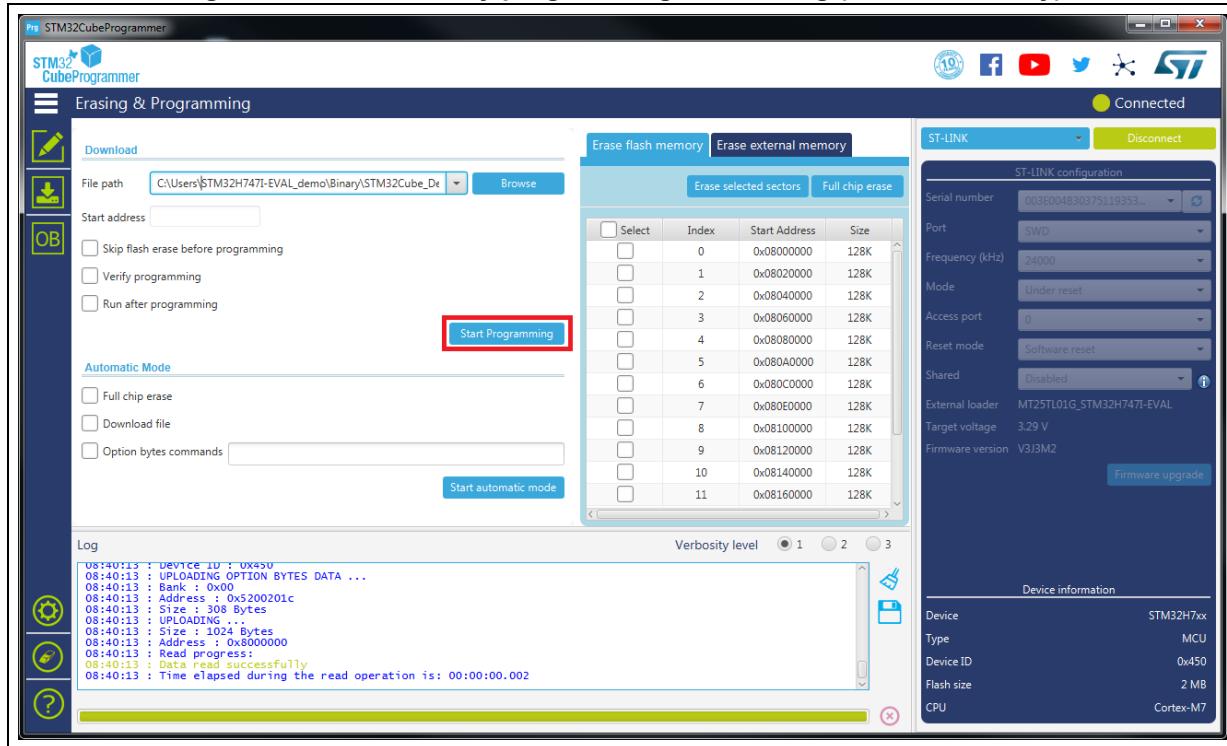

As for the ‘Device memory’ tab, user can display the file memory content in different formats (8-, 16- and 32-bit) using the ‘Data width’ combo box.

## 2.3 Memory programming and erasing

This panel is dedicated to Flash memory programming and erasing operations.

### 2.3.1 Internal Flash memory programming

**Figure 16. Flash memory programming and erasing (internal memory)**

### Memory erasing

Once connected to a target, the memory sectors are displayed in the right-hand panel showing the start address and the size of each sector. To erase one or more sectors, select them in the first column and then click on the “Erase selected sectors” button.

The ‘Full chip erase’ button erases the whole Flash memory.

## Memory programming

To program a memory execute the following steps:

1. Click on the browse button and select the file to be programmed. The file formats supported are binary files (.bin), ELF files (.elf, .axf, .out), Intel hex files (.hex) and Motorola S-record files (.Srec).
2. In case of programming a binary file, the address must be set.
3. Select the programming options:
  - Verify after programming: read back the programmed memory and compare it byte per byte with the file.
  - Skip Flash erase before programming: if checked, the memory is not erased before programming. This option must be checked only when you are sure that the target memory is already erased.
  - Run after programming: start the application just after programming.
4. Click on the ‘Start programming’ button to start programming.

The progress bar on the bottom of the window shows the progress of the erase and programming operations.

### 2.3.2

## External Flash memory programming

To program an external memory connected to the microcontroller via any of the available interfaces (e.g. SPI, FMC, FSMC, QSPI, OCTOSPI) you need an external loader.

STM32CubeProgrammer is delivered with external loaders for most available STM32 Evaluation and Discovery boards available under the “bin/ExternalLoader” directory. If you need to create a new external loader, see [Section 2.3.3](#) for more details.

To program an external memory, select one or more external loaders from the “ExternalLoader” panel to be used by the tool to read, program, or erase external memories as shown in [Figure 17](#). Once selected, the external loader(s) is (are) used for any memory operation in its (their) memory range.

The “External flash erasing” tab on the right of the “Erasing and Programming” panel displays the memory sectors for each selected loader, and enables sector or full-chip erase, as shown in [Figure 18](#).

Figure 17. Flash memory programming (external memory)

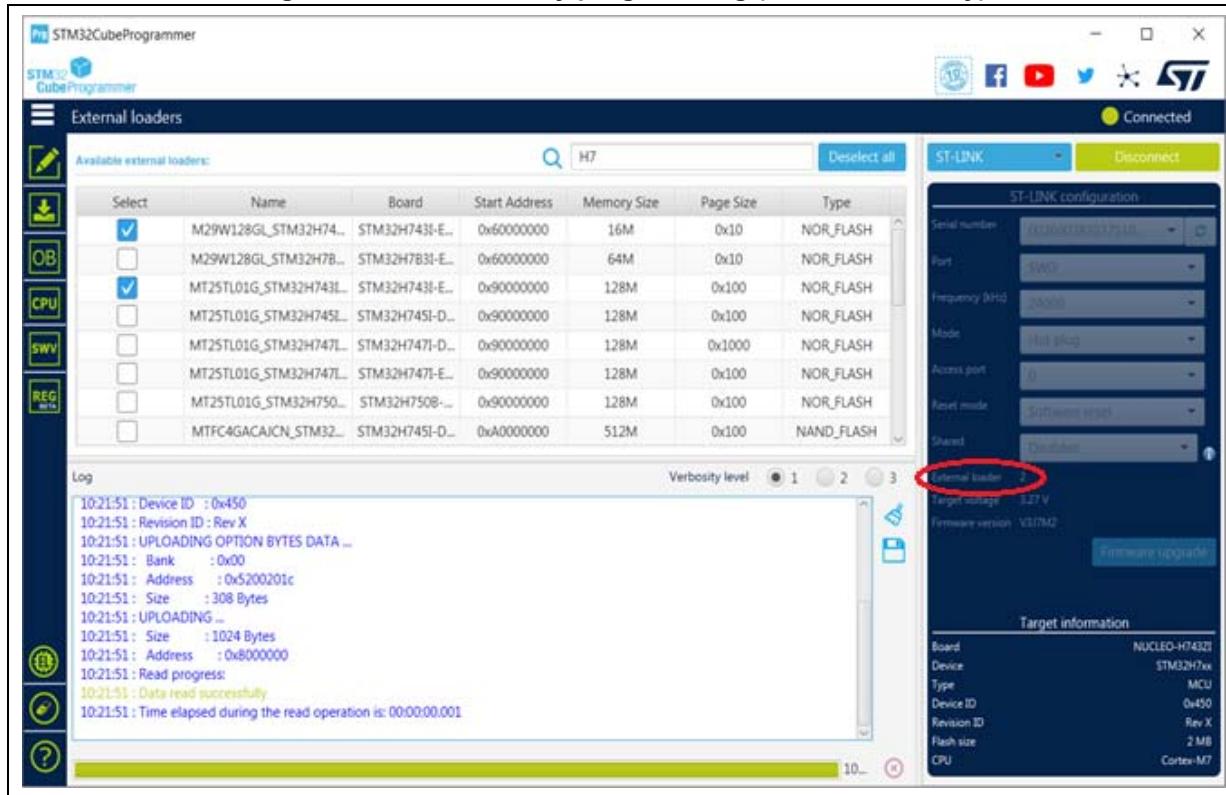

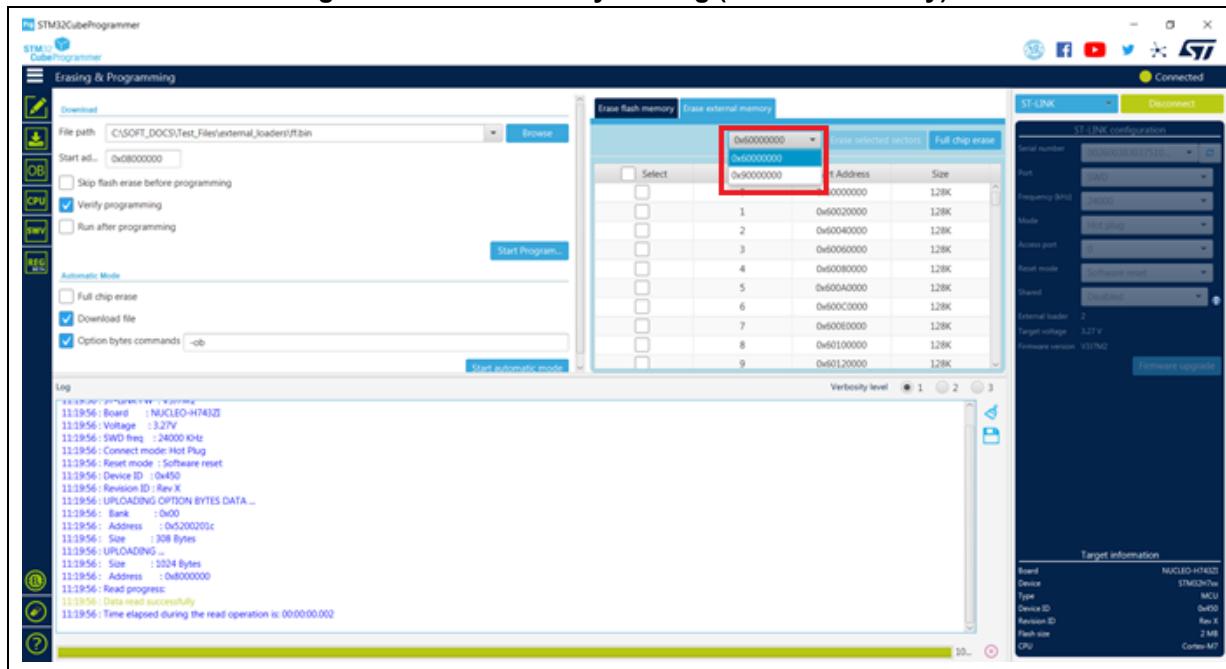

Figure 18. Flash memory erasing (external memory)

### 2.3.3 Developing customized loaders for external memory

Based on the examples available under the “*bin/ExternalLoader*” directory, users can develop their custom loaders for a given external memory. These examples are available for three toolchains: Keil® MDK, EWARM and TrueSTUDIO®. The development of custom loaders can be performed using one of these toolchains, keeping the same compiler/linker configurations, as in the examples.

The external Flash programming mechanism is the same used by the STM32 ST-LINK utility tool. Any Flash loader developed to be used with the ST-LINK utility is compatible with the STM32CubeProgrammer tool, and can be used without any modification.

To create a new external memory loader, follow the steps below:

1. Update the device information in *StorageInfo* structure in the *Dev\_Inf.c* file with the correct information concerning the external memory.
2. Rewrite the corresponding functions code in the *Loader\_Src.c* file.
3. Change the output file name.

*Note:* Some functions are mandatory and cannot be omitted (see the functions description in the *Loader\_Src.c* file).

*Linker or scatter files must not be modified.*

After building the external loader project, an ELF file is generated. The extension of the ELF file depends upon the used toolchain (.axf for Keil, .out for EWARM and .elf for TrueSTUDIO or any gcc-based toolchain).

The extension of the ELF file must be changed to ‘.stldr’ and the file must be copied under the “*bin/ExternalLoader*” directory.

#### Loader\_Src.c file

Developing an external loader for a memory, based on a specific IP requires the following functions:

- **Init** function

The **Init** function defines the used GPIO pins connecting the external memory to the device, and initializes the clock of the used IPs.

Returns 1 if success, and 0 if failure.

```
int Init (void)
```

- **Write** function

The **Write** function programs a buffer defined by an address in the RAM range.

Returns 1 if success, and 0 if failure.

```
int Write (uint32_t Address, uint32_t Size, uint8_t* buffer)
```

- **SectorErase** function

The **SectorErase** function erases the memory specified sectors.

Returns 1 if success, and 0 if failure.

```
int SectorErase (uint32_t StartAddress, uint32_t EndAddress)
```

Where “**StartAddress**” equals the address of the first sector to be erased and “**EndAddress**” equals the address of the end sector to be erased.

*Note:* This function is not used in case of an external SRAM loader.

It is imperative to define the functions mentioned above in an external loader. They are used by the tool to erase and program the external memory. For instance, if the user clicks on the program button from the external loader menu, the tool performs the following actions:

- Automatically calls the **Init** function to initialize the interface (QSPI, FMC ...) and the Flash memory
- Calls **SectorErase()** to erase the needed Flash memory sectors
- Calls the **Write()** function to program the memory

In addition to these functions, you can also define the functions below:

- **Read** function

The **Read** function is used to read a specific range of memory, and returns the reading in a buffer in the RAM.

Returns 1 if success, and 0 if failure.

```
int Read (uint32_t Address, uint32_t Size, uint16_t* buffer)
```

Where “**Address**” = start address of read operation, “**Size**” is the size of the read operation and “**buffer**” is the pointer to data read.

#### Note:

*For QSPI / OSPI (Quad-SPI / Octo-SPI) memories, the memory mapped mode can be defined in the Init function; in that case the Read function is useless since the data can be read directly from JTAG/SWD interface.*

- **Verify** function

The **Verify** function is called when selecting the “verify while programming” mode. This function checks if the programmed memory corresponds to the buffer defined in the RAM. It returns an uint64 defined as follows:

```
Return value = ((checksum<<32) + AddressFirstError)
```

where “**AddressFirstError**” is the address of the first mismatch, and “**checksum**” is the checksum value of the programmed buffer

```
uint64_t Verify (uint32_t FlashAddr, uint32_t RAMBufferAddr,
                 uint32_t Size)
```

- **MassErase** function

The **MassErase** function erases the full memory.

Returns 1 if success, and 0 if failure.

```
int MassErase (void)
```

- A Checksum function

All the functions described return 1 in case of a successful operation, and 0 in case of a fail.

## Dev\_Inf.c file

The StorageInfo structure defined in this file provides information on the external memory. An example of the type of information that this structure defines is given below:

```
#if defined (__ICCAARM__)
    __root struct StorageInfo const StorageInfo = {
#else
    struct StorageInfo const StorageInfo = {
#endif
        "External_Loader_Name", // Device Name + version number
        MCU_FLASH, // Device Type
        0x08000000, // Device Start Address
```

```

    0x00100000, // Device Size in Bytes (1MBytes/8Mbits)
    0x00004000, // Programming Page Size 16KBytes
    0xFF, // Initial Content of Erased Memory
    // Specify Size and Address of Sectors (view example below)
    0x00000004, 0x00004000, // Sector Num : 4 ,Sector Size: 16KBytes
    0x00000001, 0x00010000, // Sector Num : 1 ,Sector Size: 64KBytes
    0x00000007, 0x00020000, // Sector Num : 7 ,Sector Size: 128KBytes
    0x00000000,
};

}

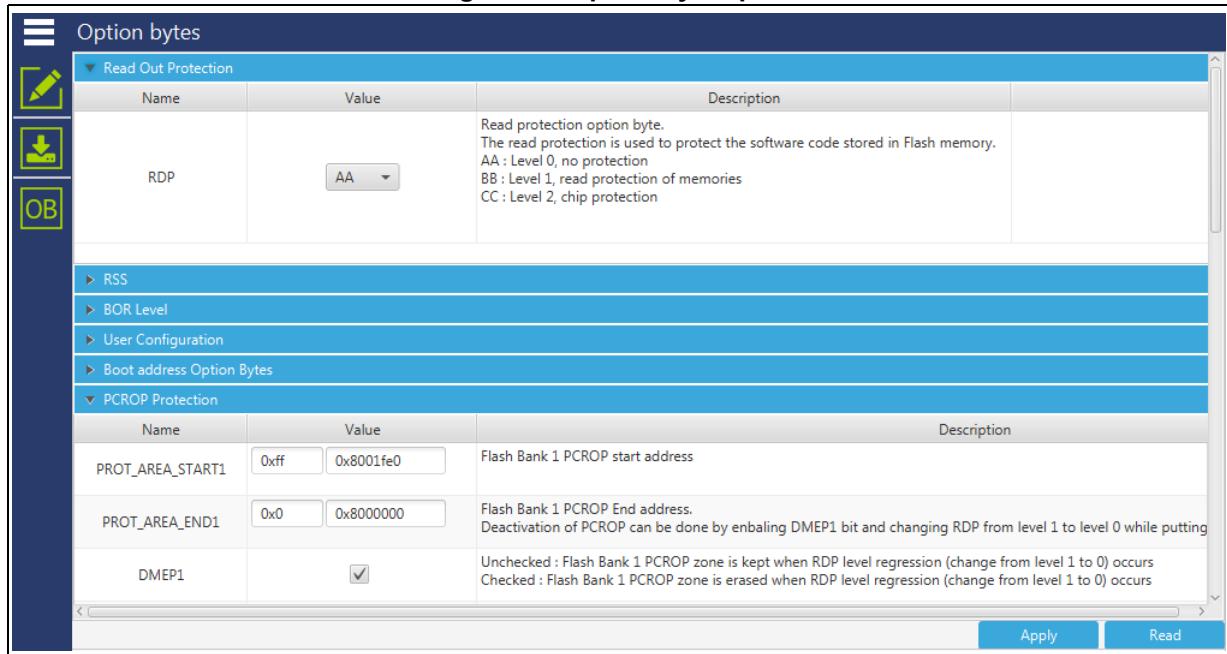

```

## 2.4 Option bytes

The option bytes panel allows the user to read and display target option bytes grouped by categories. The option bits are displayed in tables with three columns containing the bit(s) name, value and a description of the impact on the device.

The user can modify the values of these option bytes by updating the value fields, then clicking on the apply button, which programs and then verifies that the modified option bytes are correctly programmed. The user can click at any time on the read button, to read and refresh the displayed option bytes.

**Figure 19. Option bytes panel**

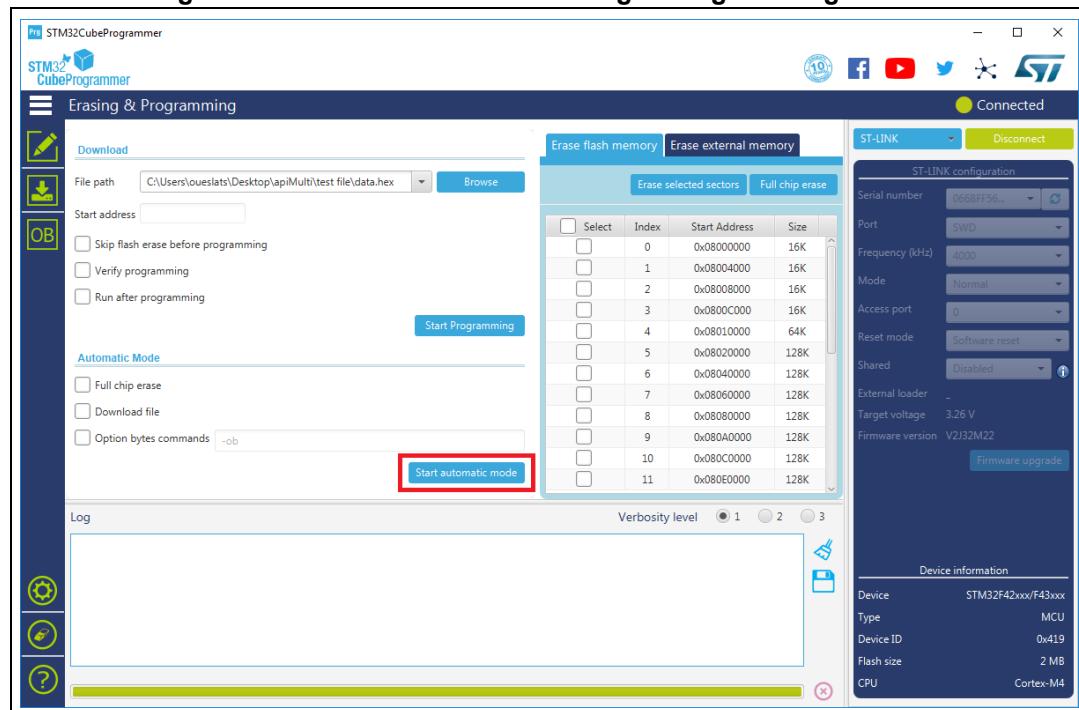

For more details refer to the option bytes section in the Flash memory programming manual and reference manual available from [www.st.com](http://www.st.com).

## 2.5 Automatic mode

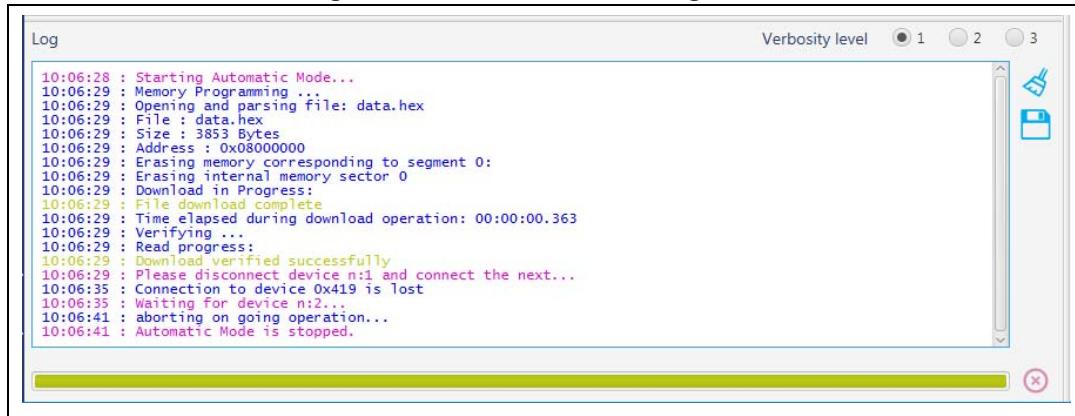

The Automatic mode feature shown in Erasing & Programming window (see [Figure 20](#)) allows the user to program and configure STM32 devices in loop. Allowed actions:

- Full chip erase: erase all the Flash memory
- Download file: activate and set programming options from Download section:
  - File path
  - Start address
  - Skip erase before programming
  - Verify programming
  - Run after programming
- Option bytes commands: configure the device by setting option bytes command line

**Figure 20. Automatic mode in Erasing & Programming window**

All automatic mode traces are indicated in the Log panel (see [Figure 21](#)) to show the process evolution and user intervention messages.

**Figure 21. Automatic mode Log traces**

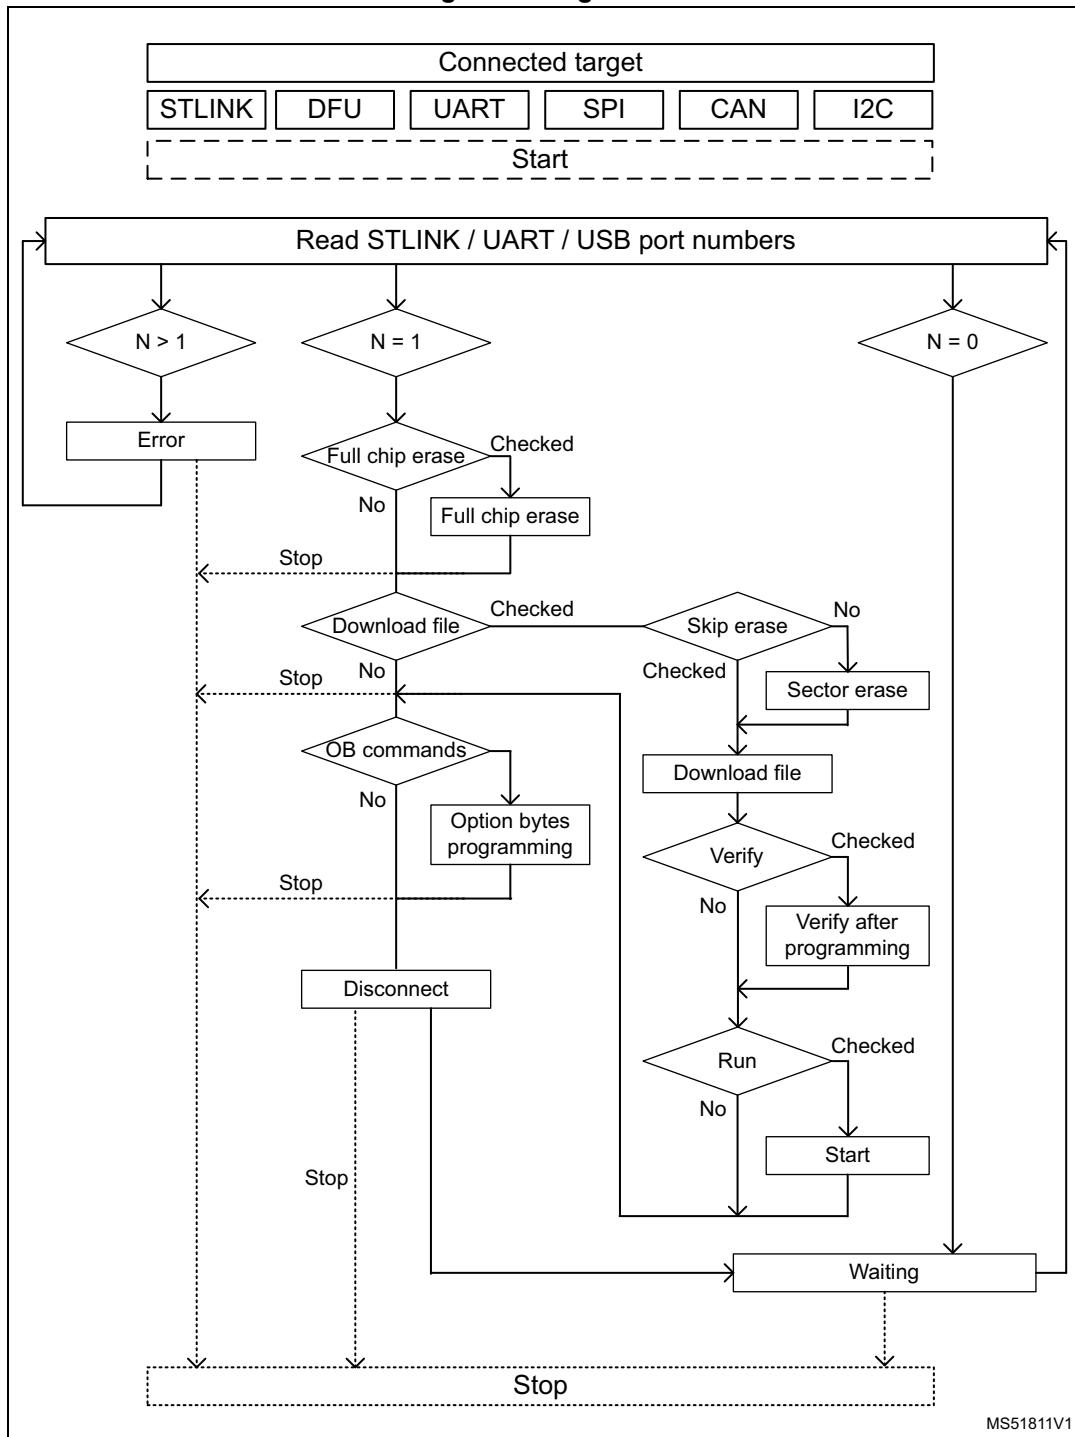

### Graphical guide

- Connection to a first target must be established before performing automatic mode to collect connection parameters values associated to all next devices.
- If the Download file is checked, the system takes all Download file options in consideration, otherwise any Download option is performed.
- If the Option bytes commands is checked, the text field is activated, then the user can insert option bytes commands (like CLI commands), and make sure that there are no white spaces at the beginning:  
-ob [OptionByte=value] [OptionByte=value] [OptionByte=value] ...
- Example of Option bytes command: “-ob BOR\_LEV=0 nBOOT0=1”
- If the Start automatic mode button is pressed, the system enters in a loop, until a system stop is called.
- While the automatic mode is in execution state, all graphical objects are disabled.
- The user can stop the process at any preferred time by pressing cancel button or stop automatic mode button.

### Log messages

- “Starting Automatic Mode...”  
Indicates that the system entered successfully in automatic process.
- “More than one ST-LINK probe detected! Keep only one ST-LINK probe! “  
The automatic mode cannot be used if more than one ST-LINK probe is connected to the computer when using JTAG/SWD interfaces. A message is displayed to prevent the user and ask him to keep only one ST-LINK probe connected to continue using this mode.
- “More than one ST-LINK Bridge detected! Keep only one ST-LINK Bridge!”  
The automatic mode cannot be used if more than one ST-LINK bridge is connected to the computer when using bootloader interface SPI/CAN/I<sup>2</sup>C interfaces. A message is displayed to prevent the user and ask him to keep only one ST-LINK bridge connected to continue using this mode.
- “More than one ST-LINK USB DFU detected! Keep only one USB DFU!”  
The automatic mode cannot be used if more than one USB DFU is connected to the computer when using USB bootloader interface. A message is displayed to prevent the user and ask him to keep only one USB DFU connected to continue using this mode.
- “More UART ports detected than last connection!”  
In the first connection time the automatic mode calculates the number of the available Serial ports and put it as a reference to detect correctly that we use only one port UART for STM32 device.
- “Please disconnect device and connect the next...”  
If the system finishes the first process, and whatever the result, disconnect the current device to prepare the second device connection.
- “Waiting for device...”  
Once the connection to the previous device is correctly lost, the system keeps searching for a new device.
- “Automatic Mode is stopped.”  
Indicates that there is a required cancel and the system stops the process.

Figure 22. Algorithm

## 2.6 In application programming (IAP/USBx)

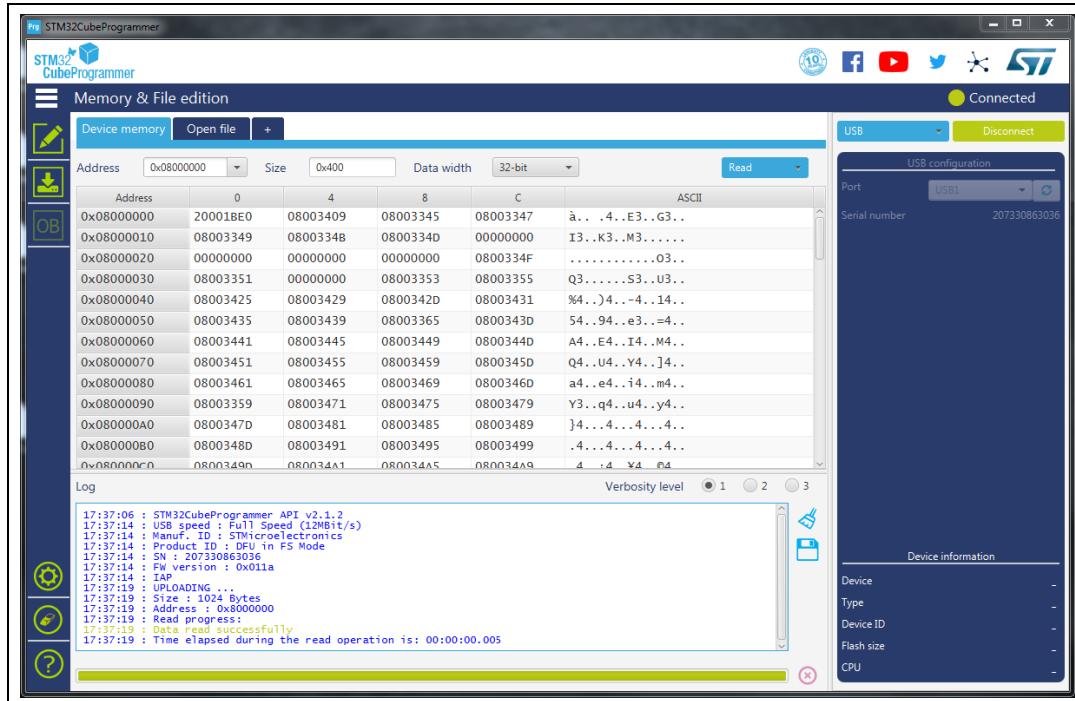

STM32CubeProgrammer supports IAP/ USBx only with USB DFU connection mode. When USB connection is chosen and the boot is from Flash memory, STM32CubeProgrammer

detects the IAP/ USBx like DFU bootloader and after connection an IAP/ USBx message appears in the log panel.

**Note:** Option byte and sector erase are not available with IAP/USBx.

Sample IAPs/ USBx are available in CubeFW/ CubeAzure on [www.st.com](http://www.st.com).

**Figure 23. STM32Cube Programmer in IAP mode**

## 2.7 Flash the co-processor binary using graphical interface

### 2.7.1 FUS / Stack upgrade

1. Use STM32CubeProgrammer (version 2.4 or higher), see [Figure 24](#)
2. Access the SWD/ bootloader USB interface, see [Figure 25](#)
3. Delete the current wireless stack, see [Figure 26](#)
4. Upgrade the FUS version the same way you would download the stack when there is not an updated FUS version
5. Download the new FUS
6. Download the new wireless stack (pop-up must appear to ensure successful upgrade), see [Figure 27](#)

**Note:** STM32CubeProgrammer (version 2.7 or higher) allows the user to install only new firmware (Stack v1.11.0 or higher). To install the old firmware, use STM32CubeProgrammer v2.6.0.

Figure 24. STM32CubeProgrammer API SWD connection

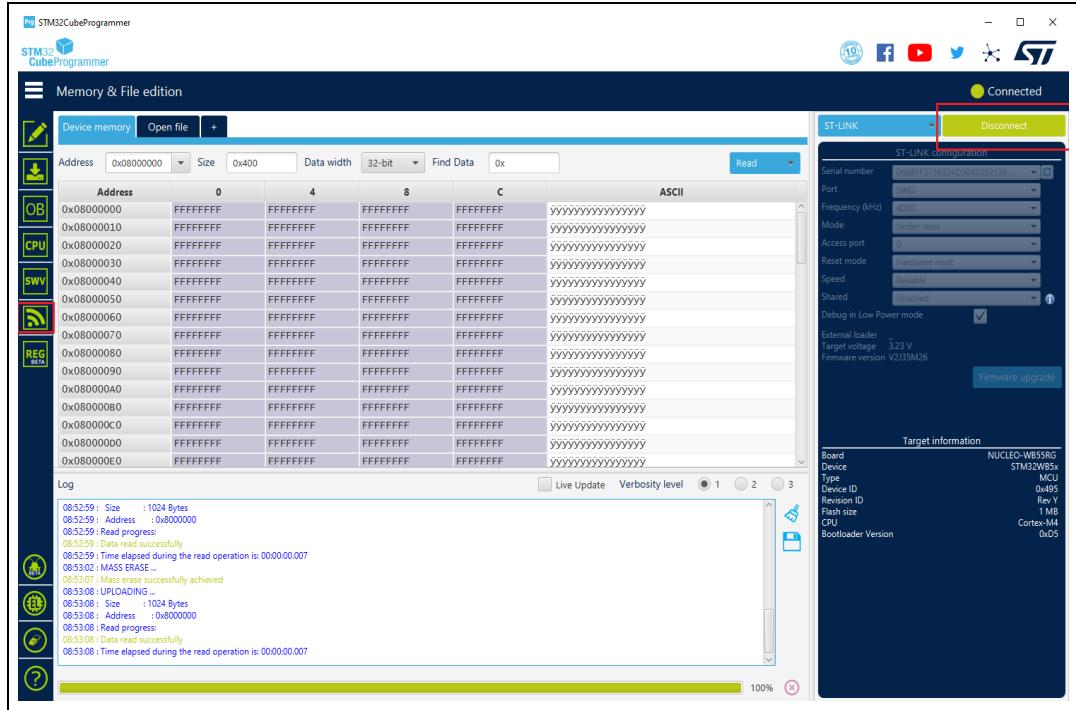

Figure 25. Steps for firmware upgrade

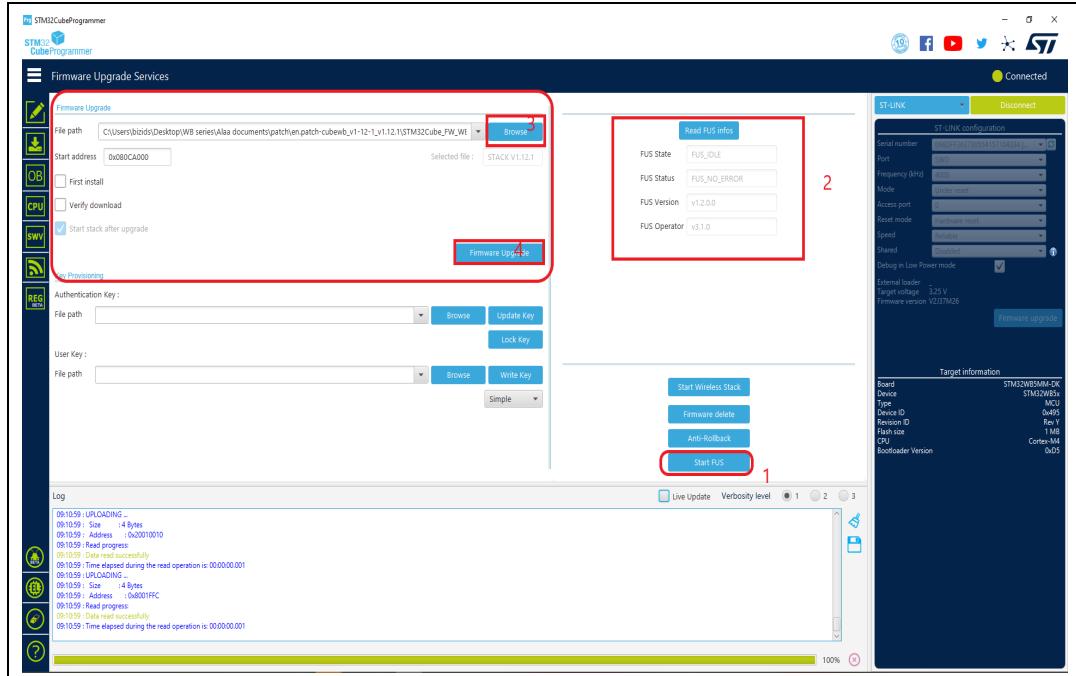

Figure 26. Pop-up confirming successful firmware delete

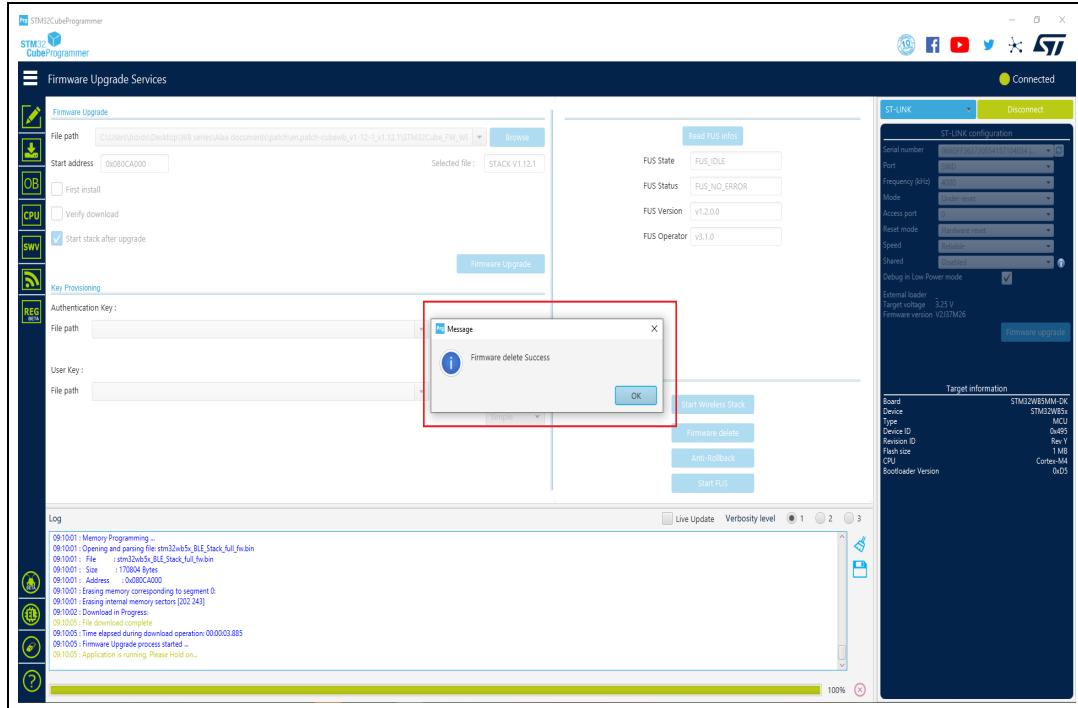

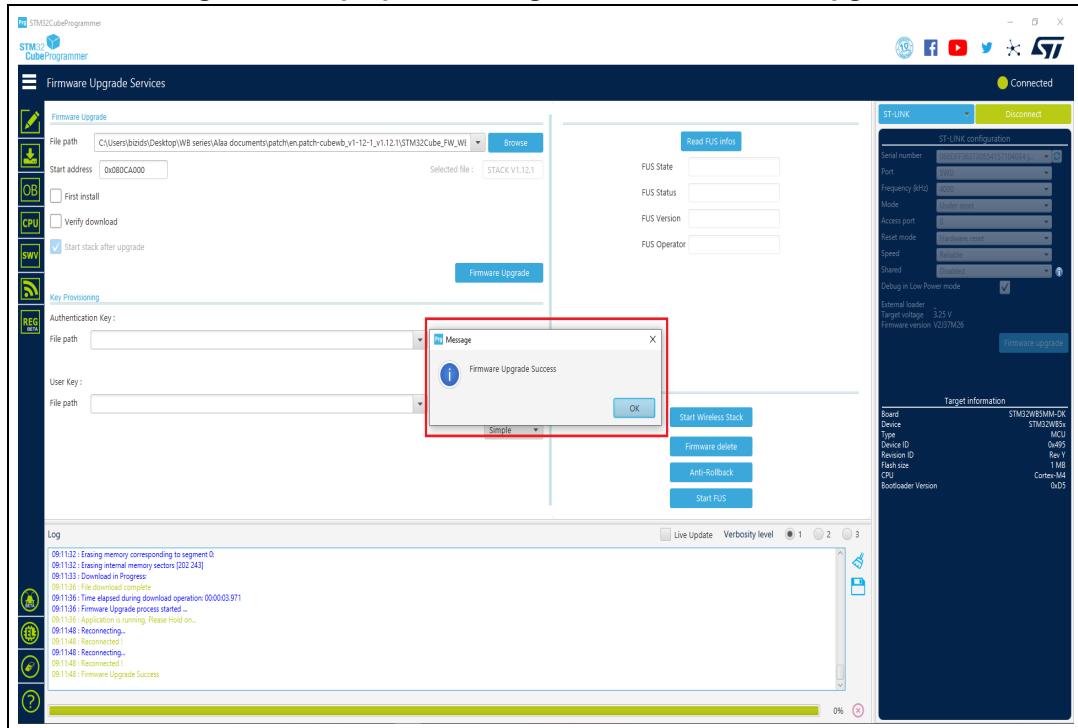

Figure 27. Pop-up confirming successful firmware upgrade

## 2.7.2 Key provisioning

STM32CubeProgrammer allows the user to add a customized signature (encrypted and signed by STMicroelectronics) to any image.

### User authentication

FUS window allows a user authentication key to be stored through the update key button (*Figure 28*).

Once the user authentication key is installed, it can be changed unless lock user authentication key button is selected (see *Figure 29*). Once the authentication key is installed, the install or upgrade services must be done with the double signed FUS/ Stack, or it will be rejected.

**Figure 28. Update authentication key**

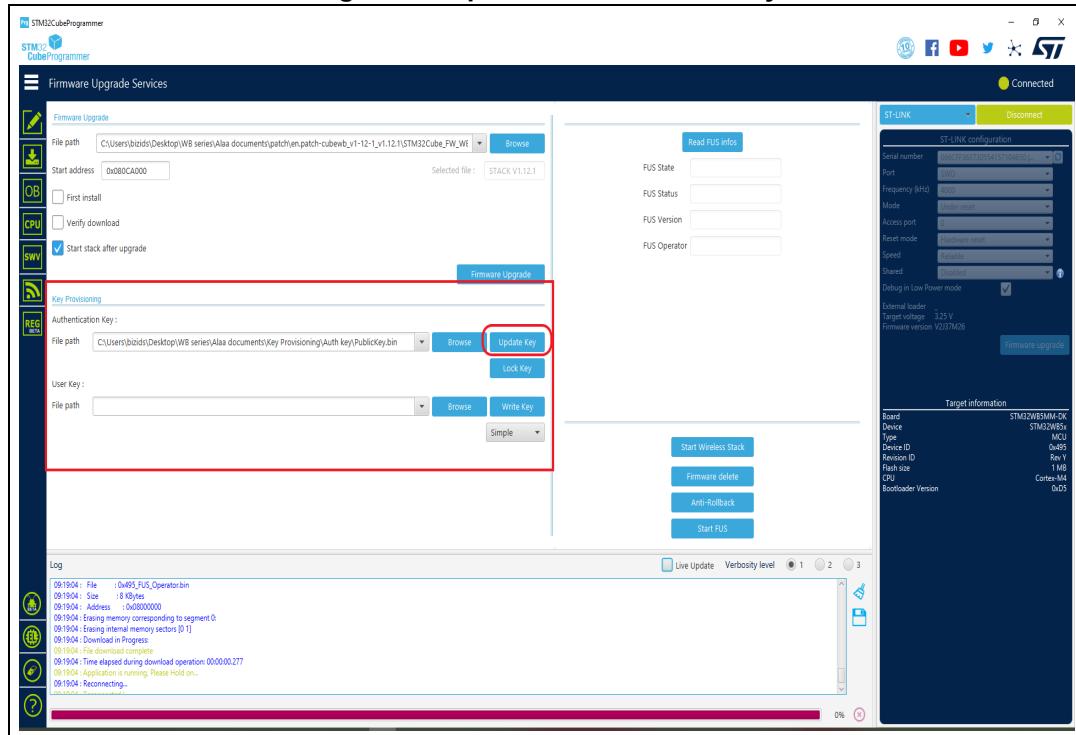

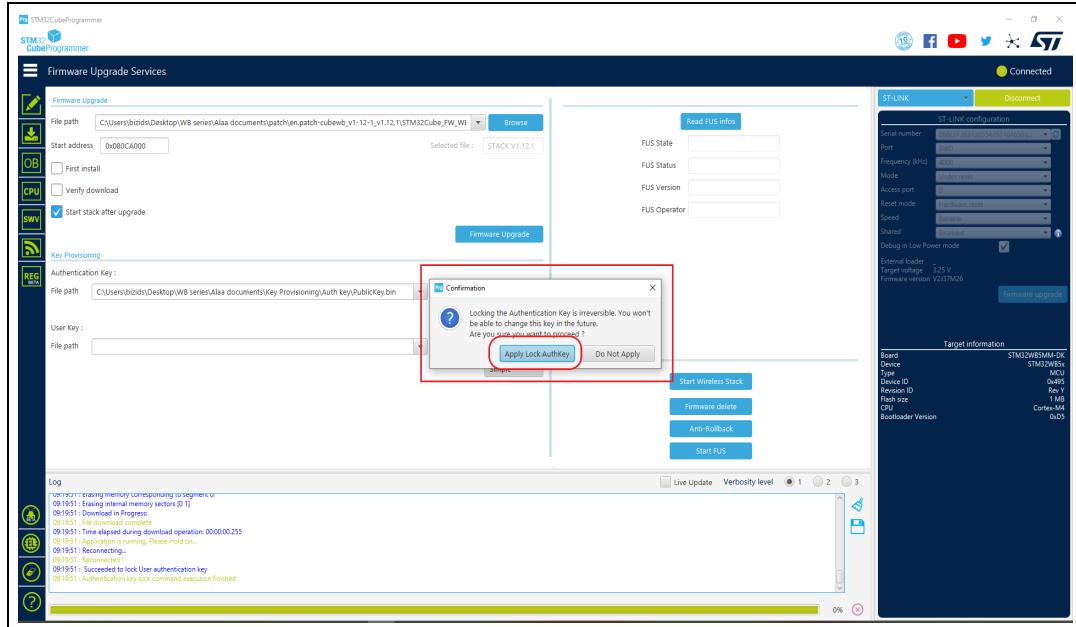

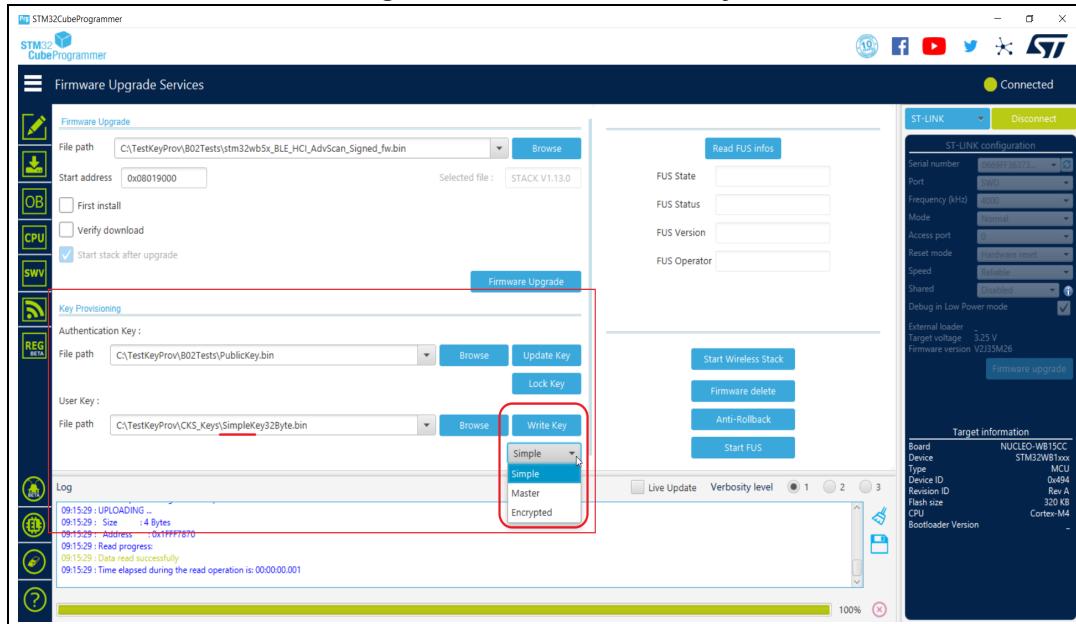

Figure 29. Pop-up requesting to lock authentication key

### Customer key storage

STM32CubeProgrammer allows customer keys to be stored in the dedicated FUS Flash memory area in binary format (user key types: simple, master or encrypted), see [Figure 30](#).

Figure 30. Store customer key

For complete documentation on STM32WBxx products visit the dedicated pages on [www.st.com](http://www.st.com).

## 2.8 Serial wire viewer (SWV)

The serial wire viewer window (see [Figure 31](#)) displays the printf data sent from the target through SWO. It displays useful information on the running firmware.

**Note:** *The serial wire viewer is only available through SWD interface.*

Before starting to receive SWO data, the user has to specify the exact target System clock frequency (in MHz) to allow the tool to correctly configure the ST-LINK and the target for the correct SWO frequency. The “Stimulus port” combo box allows the user to choose either a given ITM Stimulus port (from port 0 to 31) or receive data simultaneously from all ITM Stimulus ports.

The user can optionally specify a “.log” file to save the SWV trace log by using the “Browse” button, the default is

“\$USER\_HOME/STMicroelectronics/STM32CubeProgrammer/SWV\_Log/swv.log”.

The user can optionally check the “Activate colors” checkbox to enable colored traces output. This feature requires the original traces to contain the color codes listed below:

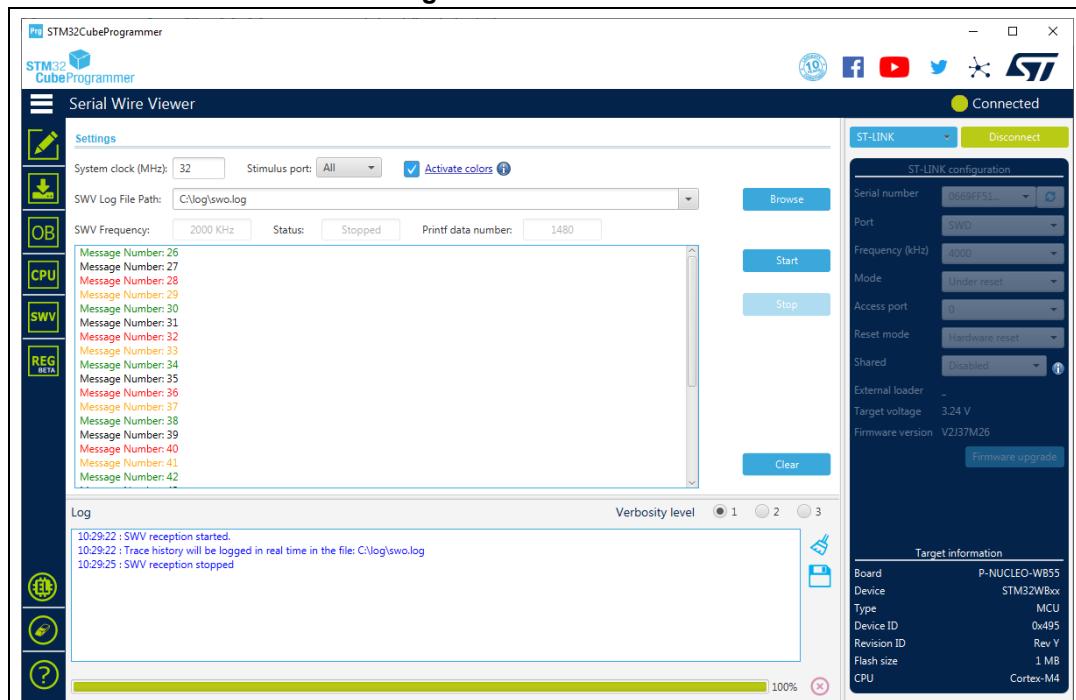

- #GRN# for green color
- #RED# for red color
- #ORG# for orange color

**Example:**

```
printf("#GRN#This outputs a green message!");
```

A help window that demonstrates the feature and shows how to use it can be accessed by clicking on the “Info icon” button next to the “Activate colors” checkbox.

**Figure 31. SWV window**

After specifying the SWV configuration, SWV reception can be started or stopped using the “Start” and “Stop” buttons. The SWO data is displayed in the dedicated area, which can be cleared by using the “Clear” button.

The SWV information bar displays useful information on the current SWV transfer, such as the SWO frequency (deduced from the system clock frequency), and the received printf data number (expressed in bytes).

*Note:* Some SWV bytes can be lost during transfer due to ST-LINK hardware buffer size limitation.

## 2.9 STM32CubeProgrammer Script Manager platform for MCUs

### 2.9.1 Introduction for the usage scenarios of Script Manager

The Script Manager platform allows to automate STM32CubeProgrammer CLI commands and adds macros to manipulate data read from STM32 MCU.

### 2.9.2 Script Manager usage

Create a file with a prg extension, then start writing the command line interface (CLI) supported by all STM32 MCUs and the specific script macros. Once you have finished filling the script, connect the STM32 board and start execution with the `-script` command in CLI mode.

Usage example: `STM32_Programmer_CLI -script myScript.prg`

The Script Manager can apply mathematical and logical operations, see [Table 1](#).

**Table 1. Operations supported by Script Manager**

| Mathematical                      | Logical   |
|-----------------------------------|---|
| <code>- +</code> (addition)       | <code>- &amp;&amp;</code> (logical AND)                 |
| <code>- -</code> (subtraction)    | <code>-   </code> (logical OR)                          |
| <code>- *</code> (multiplication) | <code>- &amp;</code> (bitwise AND)                      |
| <code>- /</code> (division)       | <code>-  </code> (bitwise OR)                           |
|                                   | <code>- ^</code> (XOR)                                  |
|                                   | <code>- &lt;&lt; &gt;&gt;</code> (left and right shift) |

Using command line interface (CLI): in this script we can use all CLI supported by STM32 MCUs (see [Section 3](#)).

Using specific Script Manager macros, to analyze, display and modify data, each macro starts with `#`. Supported macros are described below.

```
#Write macro:

#Write32(Address,data)
#Write16(Address,data)
#Write8(Address,data)
#WriteX(Address,#var)           (where X is 8/16/32)
```

Description: Downloads the specified (32/16/8)-bit data into Flash memory starting from a specified address.

**#Read macro:**

```
#Read(Address)  
#variable=#Read(Address)
```

Description: Reads 32-bit data memory from a specified address or read 32-bit data memory from a specified address and put it in the variable used by the user.

**#Display macro:**

```
#Display("message")  
#Display(#errorLevel)  
#Display(#variable)
```

Description: Displays any message, data, error level and the content of variables already used in the script.

**#Delay macro:**

```
#Delay(Time)
```

Description: Allows user to put the system in standby for a period in (ms).

**Calculate macro:**

```
#variable=[var1] op [var2]  
#variable=var1 shift (number of bits to shifted)
```

Description: Calculates with mathematical and logical operations in script manager.

Disconnection command

```
--scriptdisconnect
```

Description: Allows user to disconnect the device and reconnect to another port in the same script.

*Note:* You can add comments in the Script Manager by using “//”, as shown in the examples.

Script Manager example 1 (CLI and Script macro), see [Figure 32](#)

```
-c port=swd  
-e 0 1  
#Write32(0x08000000,0xAAAABBBB)  
#var0=#Read(0x08000000)  
#Display(#var0)
```

Script Manager example 2, see *Figure 33*

```
-c port=swd
#Write32(0x08000000,0xAAAABBBB)
--scriptdisconnect
#Delay(5000)
-c port=COM17
#Write16(0x08000004,0xCCCC)
```

Script Manager example 3

```
-c port=swd
#Display ("Hello World!")
-e 0 1
#Write32(0x08000000,0xAAAABBBB)
#Read(0x08000000)
-r32 0x08000000 0x50
#var0=#Read(0x08000000)
#Display(#errorLevel)
#Display(#var0)
#Write32(0x08000004,#var0)
#Delay(3000)
#Write16(0x08000008,0xCCCC)
#Read(0x08000004)
#Display(#errorLevel)
#var1=#Read(0x08000008)
#Display(#var1)
#Write8(0x08000010,0xDD)
#Delay(5000)
#var2=#Read(0x08000010)
#Display(#var2)
#var3=((0xbb*1)+(1-1))/1
#Display(#var3)
#Write8(0x08000014,#var3)
#var4=((0xbb & 0xaa) | 0xbb )
#Display(#var4)
#var5=((0xbb && 0xaa) || 0xbb )
#Display(#var5)
#var6=(0xbb >>1)
#Display(#var6)
-e 0 1
-w32 0x08000000 0xAAAAAAAA
-r32 0x08000000 0x50
```

## 2.10 DFU IAP/USBx with custom PID and VID

STM32CubeProgrammer DFU IAP/USBx supports not only ST product IDs while connecting via DFU IAP.

Before starting the DFU connection using a new product ID, sign your USB driver (for more info visit <http://woshub.com>).

When USB connection with a new product ID is chosen and the boot is from Flash memory, STM32CubeProgrammer detects the IAP/USBx like DFU bootloader and after connection an IAP message appears in the log panel.

To connect via the new USB DFU follow this sequence:

1. modify the default product ID
2. modify the default vendor ID
3. click on refresh button then on the connect button

**Note:** If user does not enter a PID or VID value STM32CubeProgrammer takes the default PID and VID of ST products (PID=0XDF11, VID=0X0483).

**Figure 34** shows the steps to connect via the new USB DFU panel, and **Figure 35** the main window of STM32CubeProgrammer after connection.

**Figure 34. Connect via USB DFU panel**

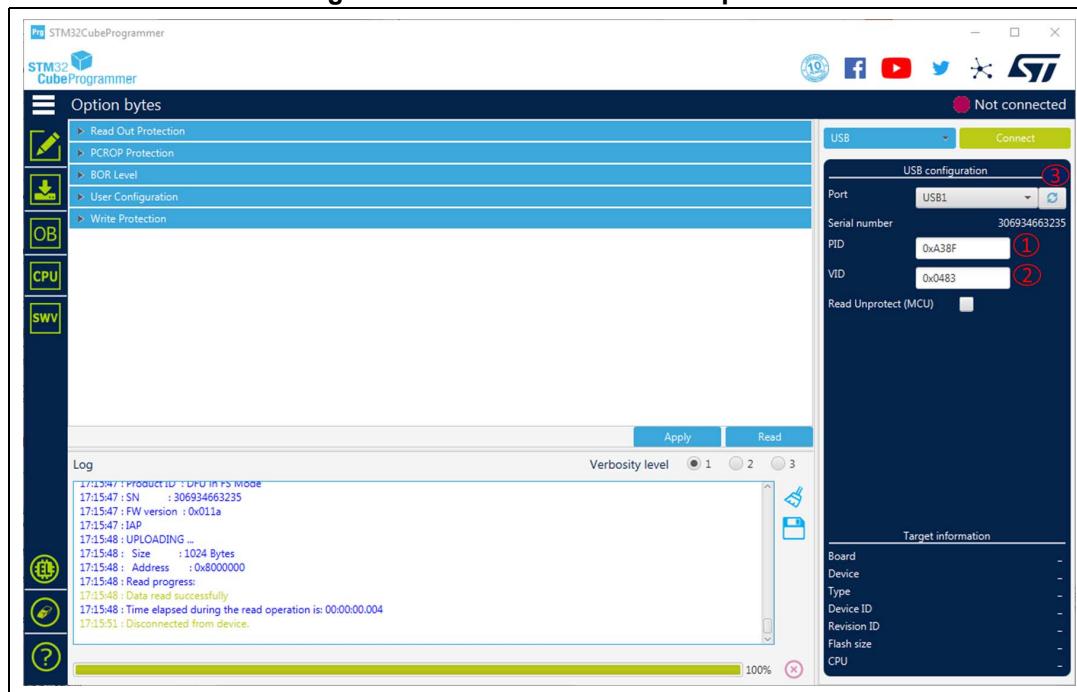

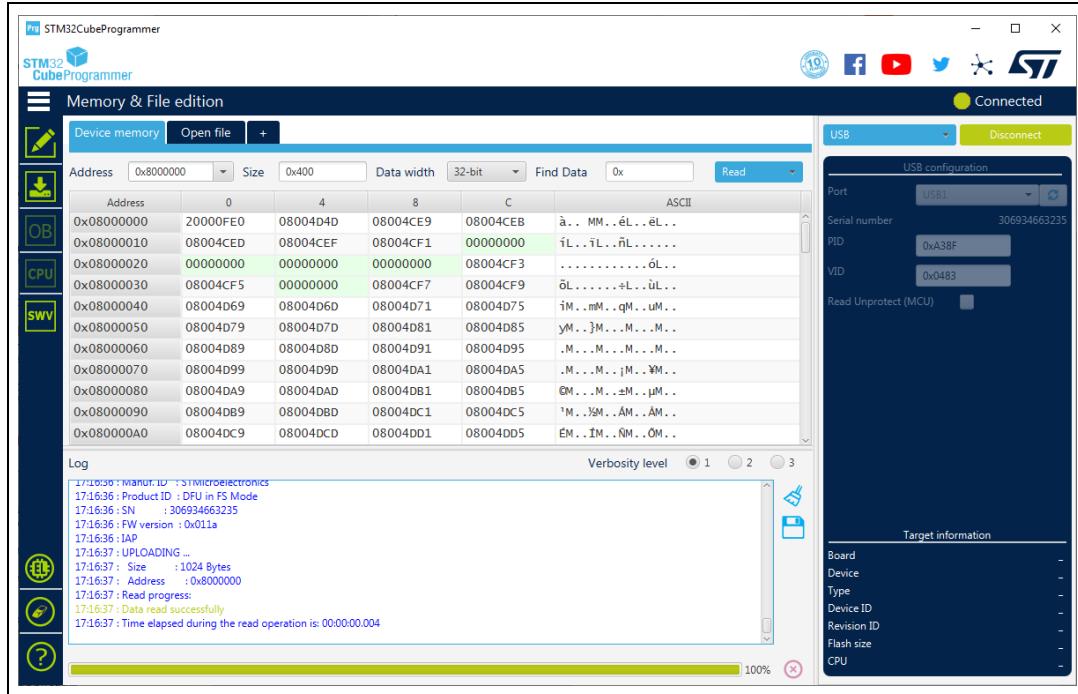

Figure 35. Main window after the connection

Note: For CLI mode check the [Section 3.2.1: Connect command](#).

## 2.11 SigFox™ credentials

As soon as an STM32WL device is connected, the window shown in [Figure 36](#) is displayed.

This window displays the chip certificate having the size of 136 bytes. The user can save it in binary file and copy the data to the clipboard.

After extracting the chip certificate, a back-end web-service verifies the data and returns two SigFox credentials: binary and header files.

### Case 1: Binary-Raw

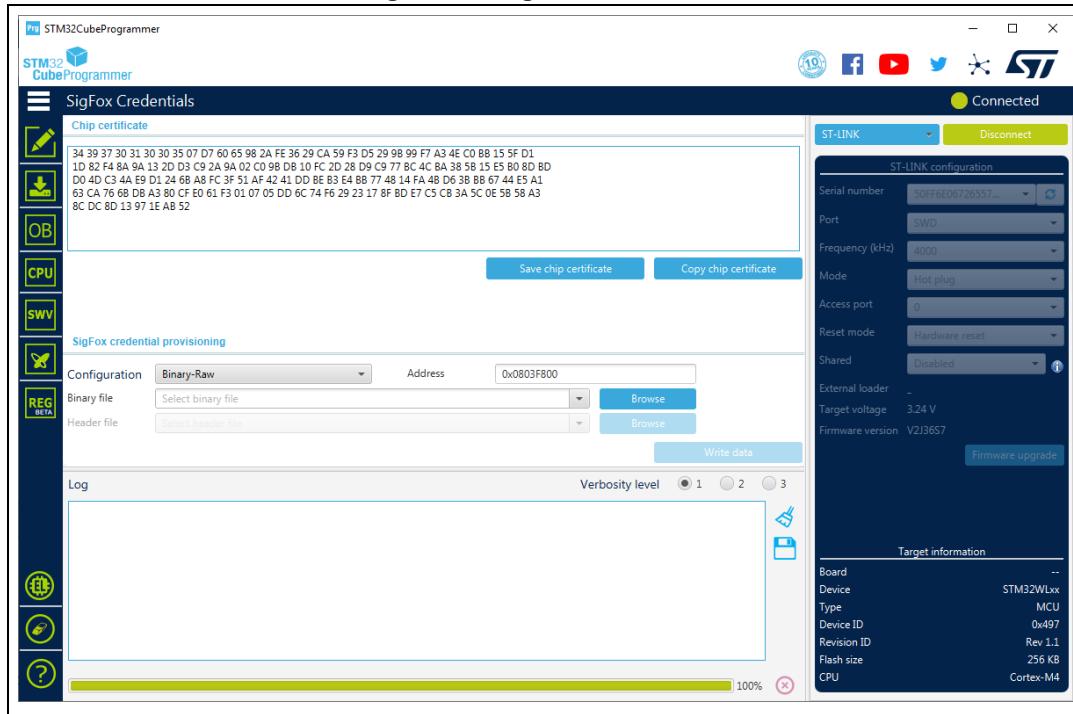

Use the binary file returned by the back-end web-service. The size of this file must be equal to 48 bytes, it is written at the default address 0x0803E500.

### Case 2: Binary KMS

Use the header file returned by the back-end web-service. It is written at the default address 0x0803E500.

Note: To access ST SigFox server using STM32CubeProgrammer, user must click on “Open Sigfox page”. A web page opens, the user must manually copy the certificate and then generate the SigFox credentials (binary and header files).

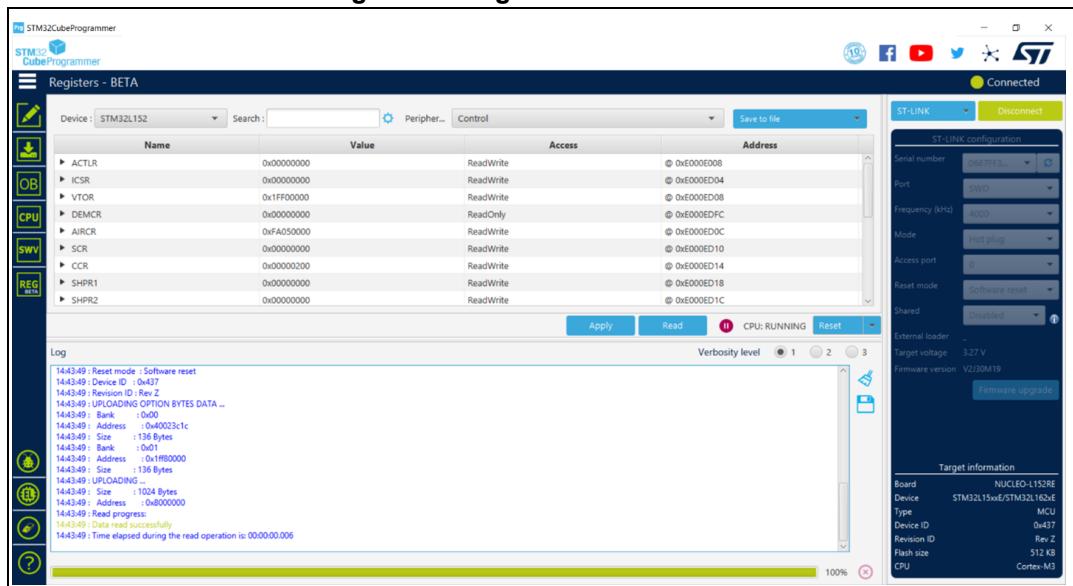

Figure 36. SigFox credentials

## 2.12 Register Viewer

STM32CubeProgrammer supports the Register Viewer feature (see [Figure 37](#)), allowing the user to visualize all the MCU and core registers in real time while running the application. It also allows the modification of MCU registers values or saving them into a log file.

Figure 37. Register Viewer window

**Note:** *The register viewer is only available through SWD/JTAG interfaces.*

Register Viewer has as input a list of files containing the data describing the mapping of the core and STM32 registers ("svd" files).

## 2.13 Hard Fault analyzer

### 2.13.1 Description

The STM32CubeProgrammer Fault Analyzer feature interprets information extracted from the Cortex-M based device to identify the reasons that caused a fault.

This information is visualized in the Fault Analyzer window in GUI mode or in CLI mode. It helps to identify system faults occurring when the CPU is driven into a fault condition by the application software.

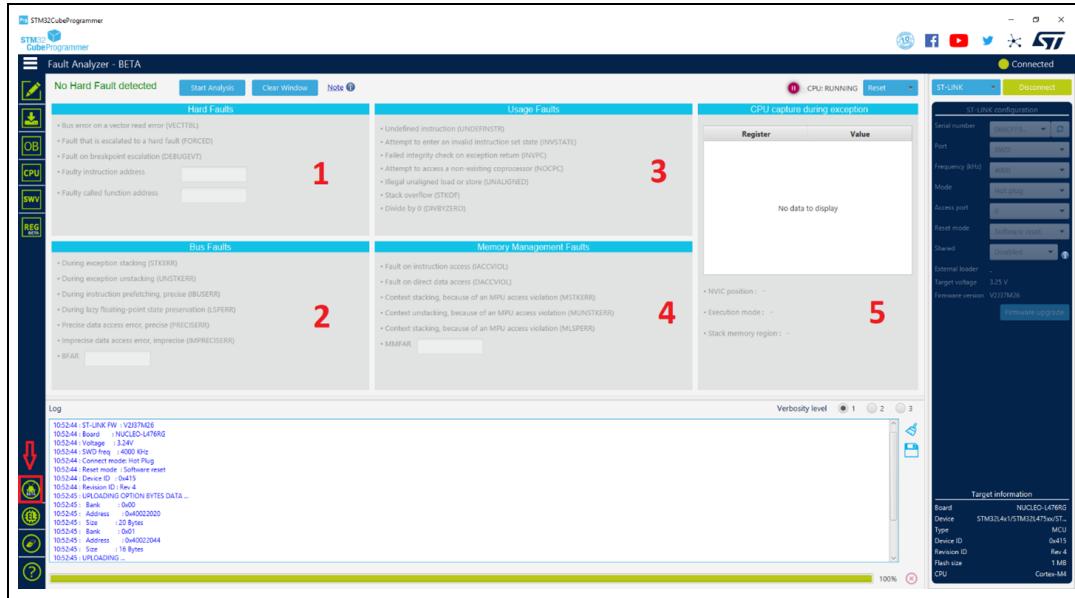

Possible detected fault exceptions:

- Hard Fault: default exception, can be triggered by an error during exception processing by Bus Fault, Memory Management Fault, or Usage Fault if their handler cannot be executed.
- Memory Management Fault: detects memory access violations to regions defined in the memory management unit (MPU), such as code execution from a memory region with read/write access only.
- Bus Fault: detects memory access errors on instruction fetch, data read/write, interrupt vector fetch, and register stacking (save/restore) on interrupt (entry/exit).
- Usage Fault: detects execution of undefined instructions, unaligned memory access for load/store multiple. When enabled, divide-by-zero and other unaligned memory accesses are detected.
- Secure Fault: provides information about security related faults for Cortex-M33 based devices.

**Note:** *Fault Analyzer is available only for ST-LINK interfaces.*

As shown in *Figure 38* the Fault Analyzer Window has five main sections.

**Figure 38. Fault Analyzer window**

1. Hard Faults details: indicates the type of occurred fault, locates the instruction and the called function addresses.
2. Bus Faults details: shows the status of bus errors resulting from instruction fetches and data accesses and indicates memory access faults detected during a bus operation. An address should be displayed on the BFAR text field.
3. Usage Faults details: contains the status for some instruction execution faults, and for data access.
4. Memory Management Faults details: indicates a memory access violation detected by the MPU. If this fault was triggered by a faulty address, access is displayed on the MMFAR text field.
5. CPU capture during exception: shows the CPU state when an exception was generated to have an overview for CPU registers and some helpful information.
  - a) NVIC position: indicates the number of the interrupt imposing the error, if it is “-“ the interrupt/exception vector has no specific position.
  - b) Execution mode: indicates the operation mode Handler/Thread.
  - c) Stack memory region: indicates the used stack memory during the fault, Main or Process stack.

## 2.13.2 Example

Develop a simple application that generates a Usage fault, set an instruction making a divide by zero (a non-permitted operation) in the main program function.

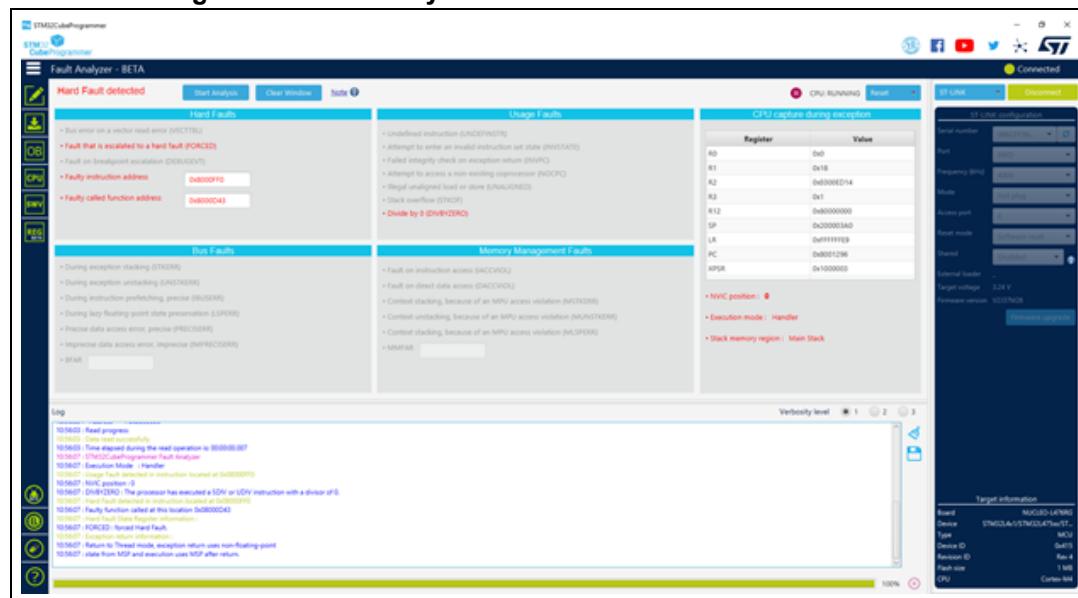

```
int a = 4, b = 0, c = 0;
c = a / b;
```

Open the Fault Analyzer window, press the “Start Analysis” button to start the fault detection algorithm, the reason of the error is displayed.

In this example, it displays “Hard Fault Detected”, and the label “divide by zero (DIVBYZERO)” is highlighted with additional informations:

- Faulty instruction address: 0x8000FF0
- Faulty called function address: 0x8000D40, indicates the address calling the faulty instruction.
- NVIC position: 0, window watchdog interrupt
- Execution mode: Handler
- Stack memory region: main stack

**Figure 39. Fault analyzer GUI view when Hard Fault detected**

## 2.13.3 Fault Analyzer note

Fault Analyzer may be unable to detect untracked faults since they were not enabled by software.

The configuration and control register (CCR) controls the behavior of the Usage Fault for divide by-zero and unaligned memory accesses and it is used mainly to control customizable fault exceptions.

The following bits of the CCR control the behavior of the Usage Fault:

**Figure 40. CCR bits**

| 31       | ... | 10       | 9        | 8 | 7        | 6 | 5         | 4           | 3 | 2        | 1           | 0              |
|----------|-----|----------|----------|---|----------|---|-----------|-------------|---|----------|-------------|----------------|
| Reserved |     | STKALIGN | BFHFNIGN |   | Reserved |   | DIV_0_TRP | UNALIGN_TRP |   | Reserved | USERSETPEND | NONBASETHRDENA |

- DIV\_0\_TRP: Enable Usage Fault when the processor executes an SDIV or UDIV instruction with a 0 divider.
  - 0 = do not trap divide by 0; a divide by 0 returns a quotient of 0.
  - 1 = trap divide by 0.
- UNALIGN\_TRP: enable usage fault when a memory access to unaligned addresses is performed.
  - 0 = do not trap unaligned half-word and word accesses
  - 1 = trap unaligned half-word and word accesses; an unaligned access generates a usage fault.

Note that unaligned accesses with LDM, STM, LDRD, and STRD instructions always generate a usage fault, even when UNALIGN\_TRP is set to 0.

STM32CubeProgrammer enables the required bits at the analysis startup, if no fault detected an informative popup is displayed to indicate that you must reproduce the scenario and restart the fault Analysis.

#### 2.13.4 Secure Fault Analyzer for Cortex-M33

STM32CubeProgrammer provides information about security related faults for Cortex-M33 based devices for both CLI and GUI interfaces.

A new field named “Secure Faults” is added to Fault Analyzer window when you connect a device based on Cortex-M33 (such as MCUs of the STM32L5 Series).

The result analysis is based on Secure Fault Status Register (SFSR) settings and a fault is triggered if an error occurs:

- INVEP: this bit is set if a function call from the Non-secure state or exception targets a non-SG instruction in the Secure state. This bit is also set if the target address is a SG instruction, but there is no matching SAU/IDAU region with the NSC flag set.
- INVIS: this bit is set if the integrity signature in an exception stack frame is found to be invalid during the unstacking operation.
- INVER: set to 1 when returning from an exception in the Non-secure state.
- AUVOIOL: attempt was made to access parts of the address space that are marked as Secure with NS-Req for the transaction set to Non-secure. This bit is not set if the violation occurred during lazy state preservation.
- INVTRAN: indicates that an exception was raised due to a branch not flagged as being domain crossing causing a transition from Secure to Non-secure memory.

- LSPERR: Indicates that an SAU or IDAU violation occurred during the lazy preservation of floating-point state.
- SFARVALID: this bit is set when the SFAR register contains a valid value.
- LSERR: indicates that an error occurred during lazy state activation or deactivation.
- SFAR: indicates the address value when a secure fault is raised.

## 2.14 Fill memory command

### -fillmemory

**Description:** This command allows the user to fill memory with a given pattern from the chosen address.

**Syntax:** `-fillmemory <start_address> [size=<value>] [pattern=<value>] [datawidth=8|16|32]`

**<start\_address>:** Start address for write.  
The address 0x08000000 is used by default.

**[size=<value>]:** Size of the data to write.

**[pattern=<value>]:** The pattern value to write.

**[datawidth=8|16|32]:** Filling data size, can be 8, 16 or 32 bits.  
The selected value by default is 8 bits.

- Example 1: STM32\_Programmer\_CLI.exe -c port=swd -fillmemory 0x08000000 size=0x10 pattern=0XAA datawidth=16 ([Figure 41](#))
- Example 2: STM32\_Programmer\_CLI.exe -c port=swd -fillmemory 0x08000000 size= 0x10 pattern=0XCC datawidth=32 ([Figure 42](#))

Figure 41. Example 1

```
ST-LINK SN : 0670FF554949677067035117

Erasing internal memory sector 0
                                                 100%

Downloading 16-bit data achieved successfully
The filling memory operation achieved successfully
```

Figure 42. Example 2

```
ST-LINK SN : 0670FF554949677067035117
ST-LINK FW : V2J30M20
Board      : STM32H743 -EV
Voltage    : 3.22V
SWD freq   : 4000 KHz
Connect mode: Normal
Reset mode  : Software reset
Device ID   : 0x450
Revision ID : Rev Z
Device name : STM32H7xx
Flash size  : 2 MBytes
Device type : MCU
Device CPU  : Cortex-M7

Filling memory operation:
  Start address          : 0x08000000
  Size(Bytes)           : 0x00000010
  Data value             : 0x000000CC
  Filling data size(Bytes): 32 bits

Erasing internal memory sector 0
                                                 100%

Downloading 32-bit data achieved successfully
The filling memory operation achieved successfully
```

## 2.15 Fill memory operation

The user can open the Fill memory window from different sub-menus.

Figure 43. Sub-menu displayed from “Read” combo-box

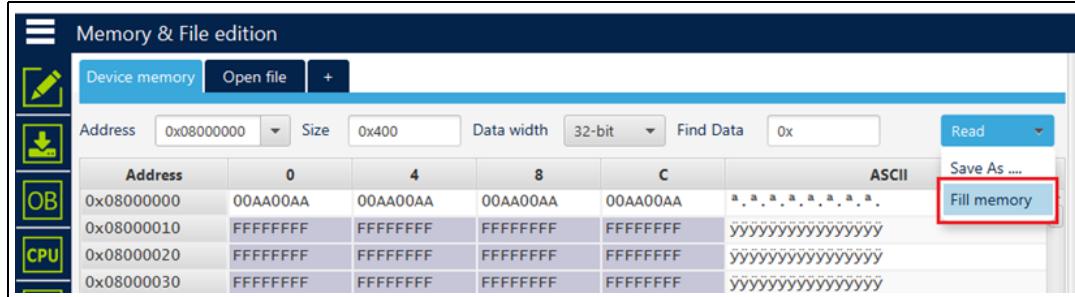

Figure 44. Sub-menu displayed with right click on “Device memory” tab

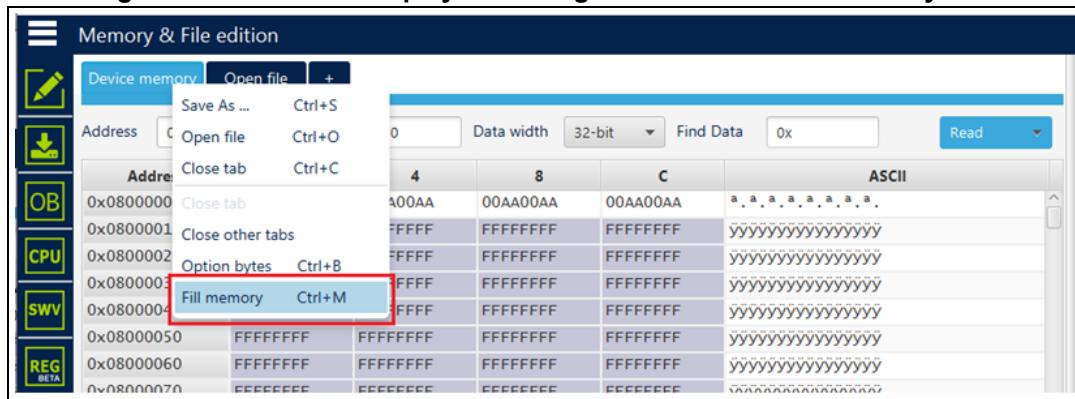

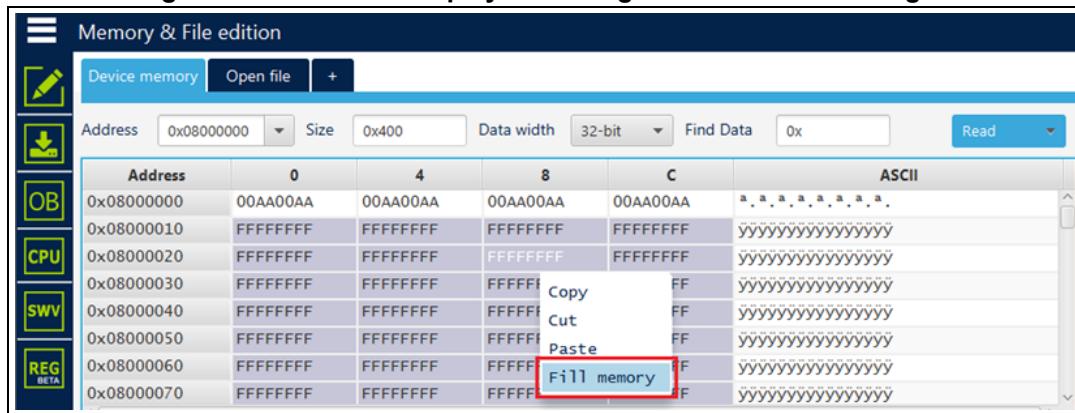

Figure 45. Sub-menu displayed with right click on the cell of grid

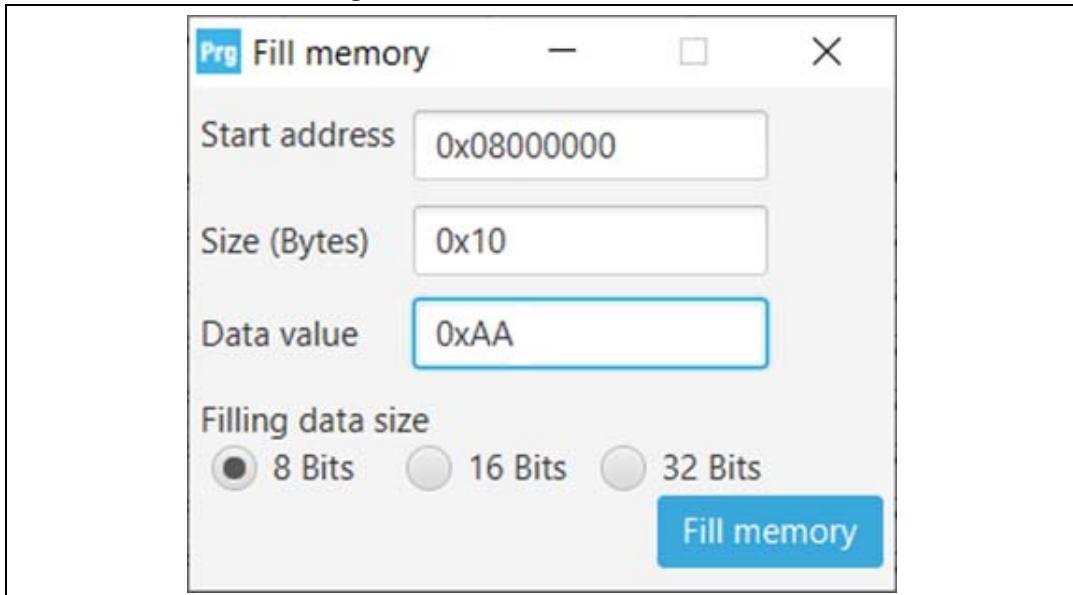

Note:

*In addition to sub-menus to display this window, user can open it directly by using the key combination “Ctrl+M”.*

After clicking on “Fill memory” option, a window is displayed so that the user can initialize the parameters of the operation (see [Figure 46](#)).

Figure 46. Parameters initialization

## 2.16 Blank check command

**-blankcheck**

**Description:** This command allows the user to verify that the STM32 Flash memory is blank. If this is not the case, the first address with data is highlighted in a message.

**Syntax:** **-blankcheck**

**Examples:** STM32\_Programmer\_CLI.exe -c port=swd –blankcheck

Figure 47. Example 1: Flash memory is not blank at address 0x08000014

```
ST-LINK SN : 0670FF554949677067035117
ST-LINK FW : V2J30M20
Board      : STM32H743 -EV
Voltage    : 3.23V
SWD freq   : 4000 KHz
Connect mode: Normal
Reset mode  : Software reset
Device ID   : 0x450
Revision ID : Rev Z
Device name : STM32H7xx
Flash size  : 2 MBytes
Device type : MCU
Device CPU  : Cortex-M7

Flash memory blank checking...

[Progress Bar] 100%

Warning: Flash memory is not blank at 0x08000014.
```

**Figure 48. Example 1: Flash memory is blank**

```
ST-LINK SN   : 0670FF554949677067035117
ST-LINK FW   : V2J30M20
Board       : STM32H743 -EV
Voltage     : 3.22V
SWD freq    : 4000 KHz
Connect mode: Normal
Reset mode  : Software reset
Device ID   : 0x450
Revision ID : Rev Z
Device name : STM32H7xx
Flash size  : 2 MBytes
Device type : MCU
Device CPU  : Cortex-M7
```

Flash memory blank checking...

100%

Flash memory is blank.

## 2.17 Blank check operation

The user can open the Fill memory window from different sub-menus.

**Figure 49.** Sub-menu displayed from “Read” combo-box

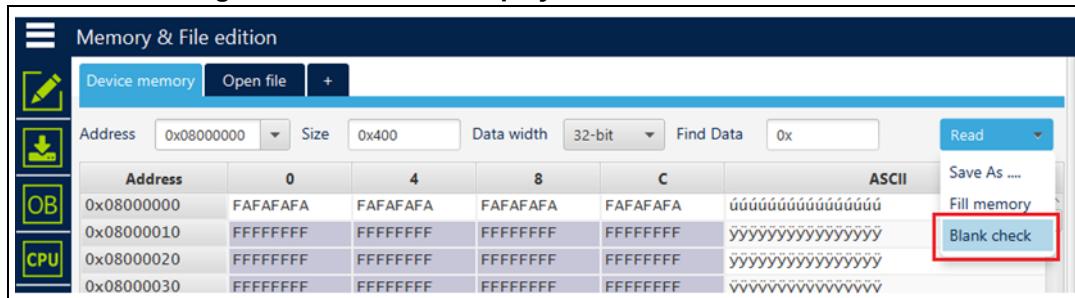

Figure 50. Sub-menu displayed with right click on “Device memory” tab

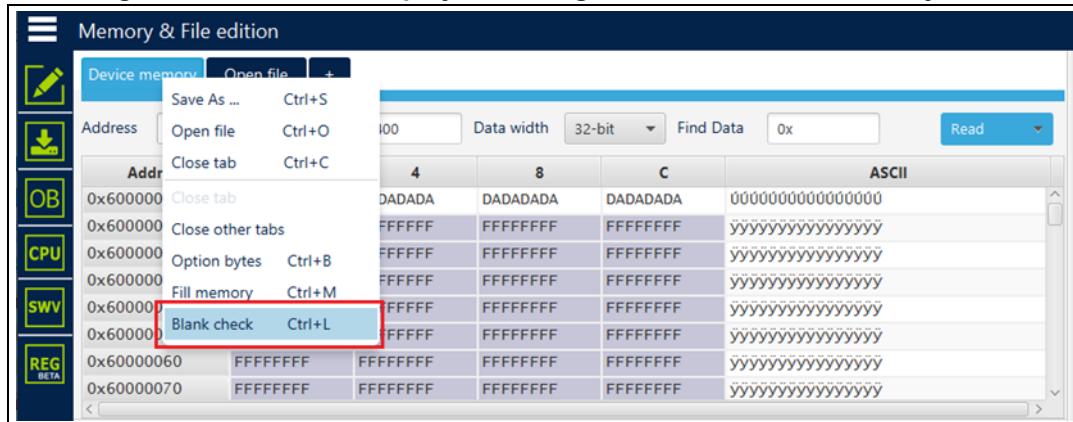

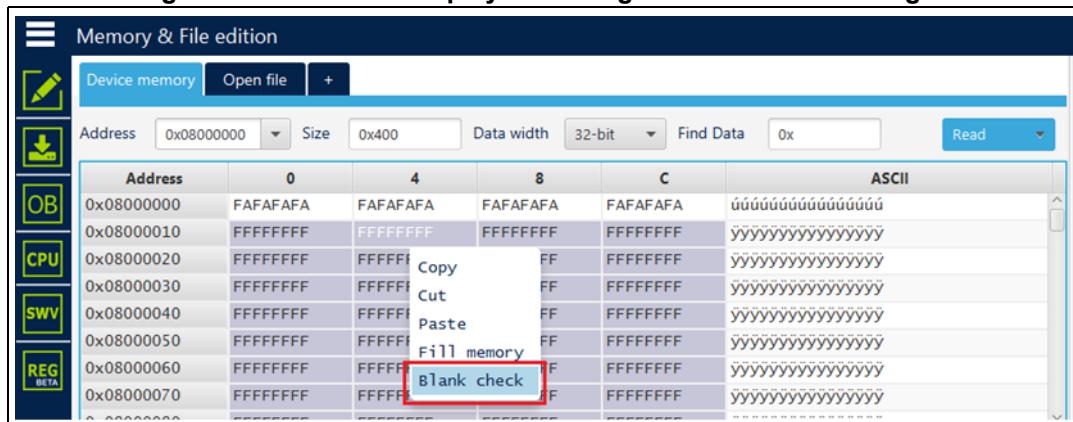

Figure 51. Sub-menu displayed with right click on the cell of grid

Note: In addition to sub-menus to display this window, user can launch the operation directly by using the key combination Ctrl+L.

After clicking on “Blank check” sub-menu, the process starts to verify that the STM32 Flash memory is blank. If the Flash memory is not blank, the first address with data is highlighted in a message, as shown in [Figure 52](#).

The expected results are shown in [Figure 53](#) and [Figure 54](#).

Figure 52. First address with data

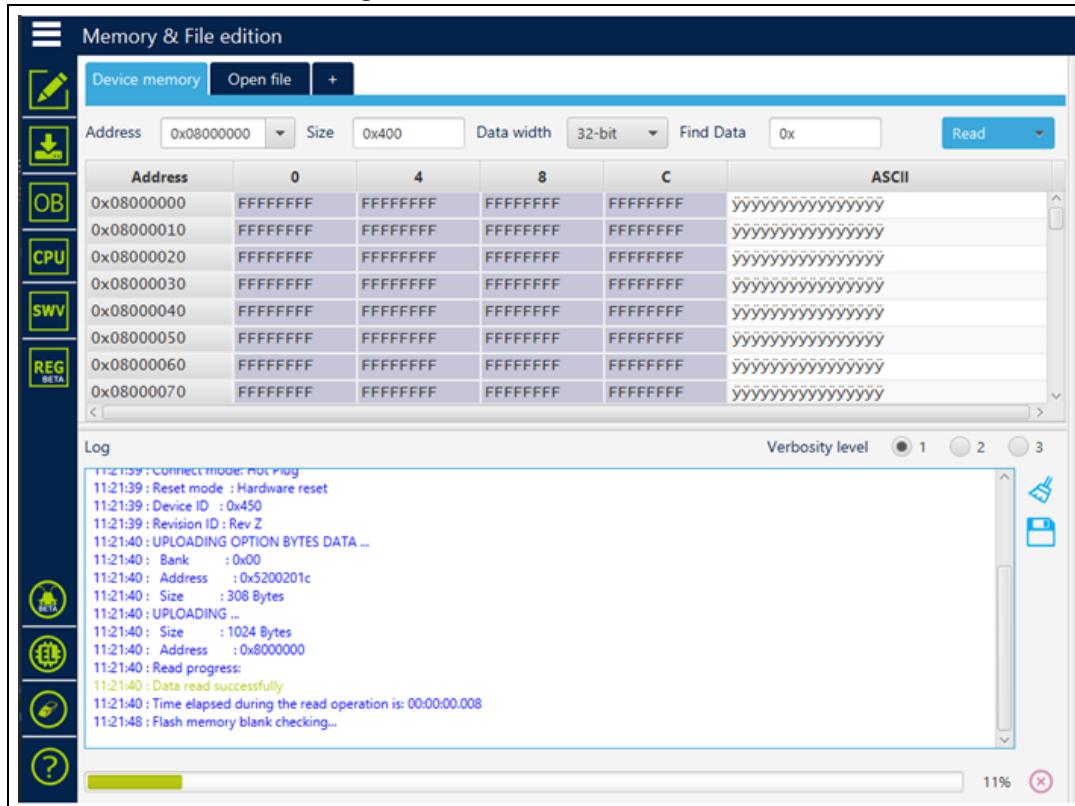

Figure 53. Example 1: Flash memory is blank

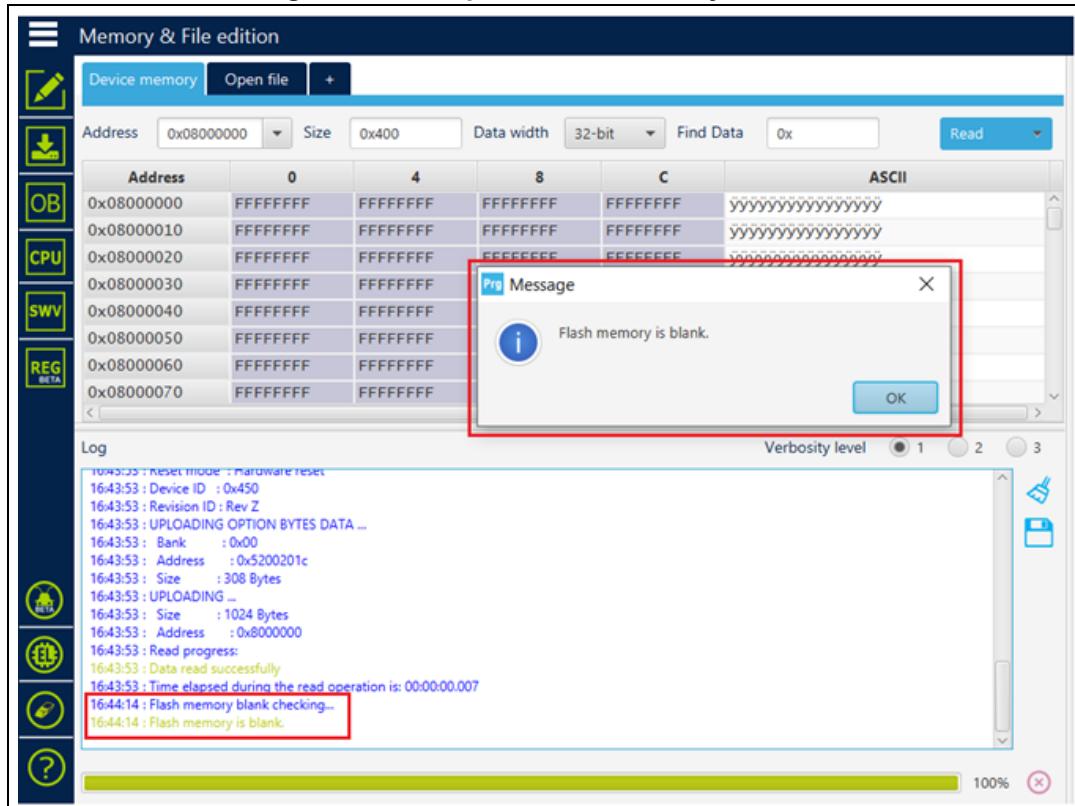

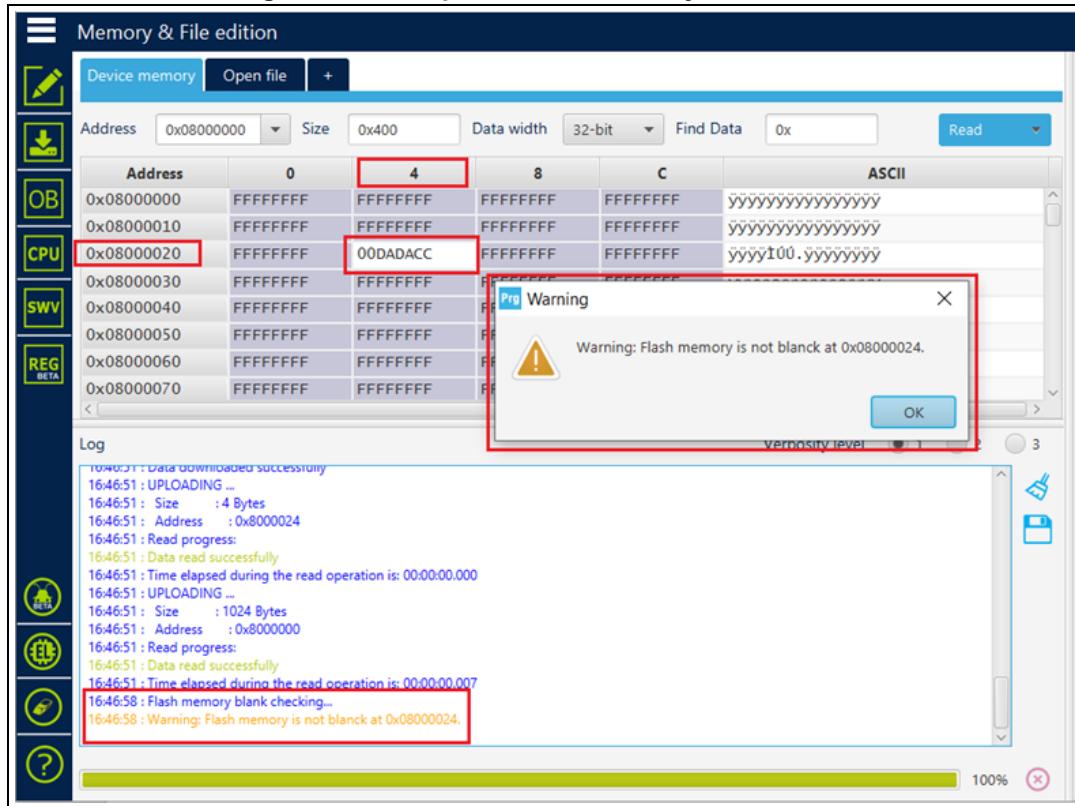

Figure 54. Example 2: Flash memory is not blank

## 2.18 Compare Flash memory with file

**Description:** Compares the MCU device memory content with a binary, hex, srec, elf, out and axf file. The difference is shown in red in the file and in the Flash memory panel.

The user can open the comparison window from different sub-menus.

Figure 55. Sub-menu displayed from “Read” combo-box

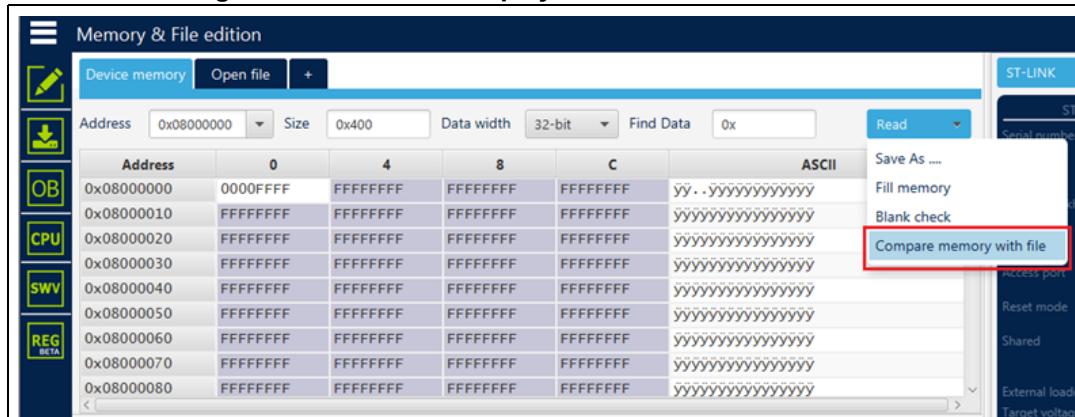

Figure 56. Sub-menu displayed with right click on “Device memory” tab

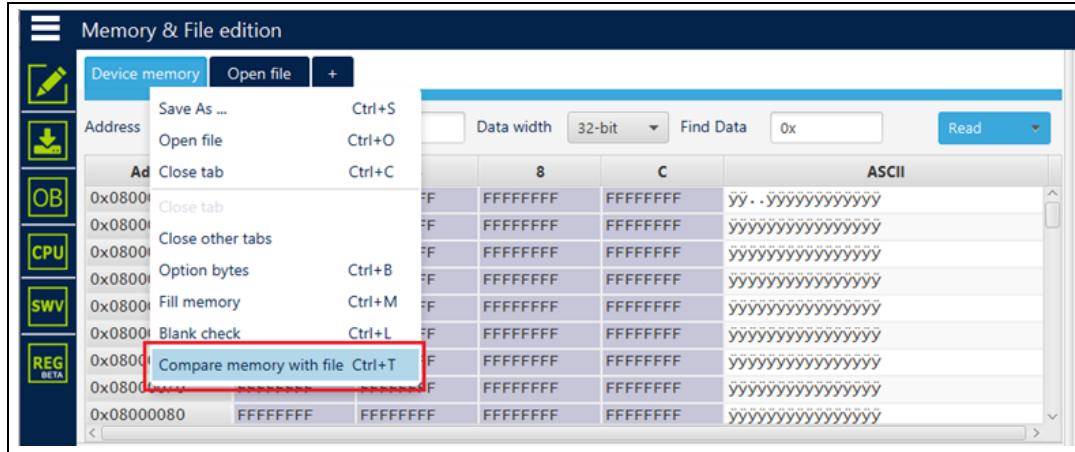

Figure 57. Sub-menu displayed with right click on the cell of grid

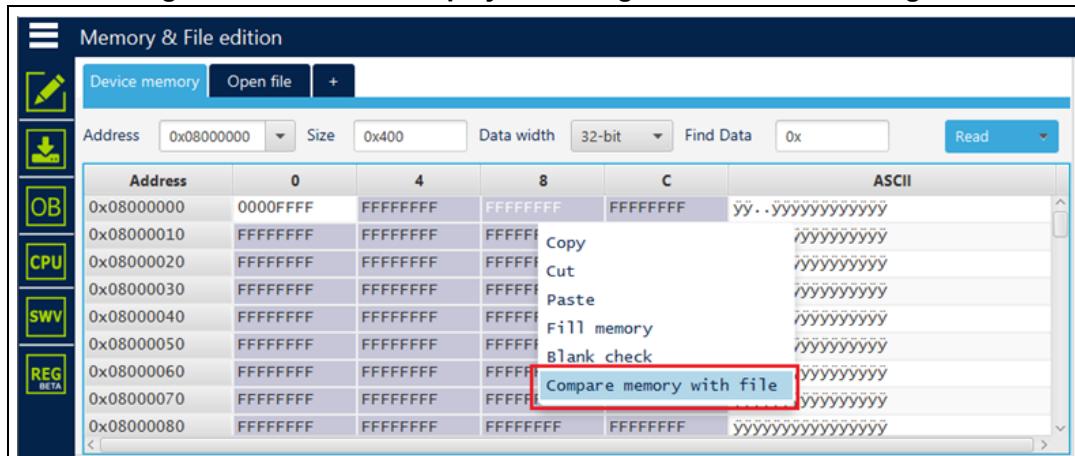

Figure 58. Sub-menu displayed with add tab button

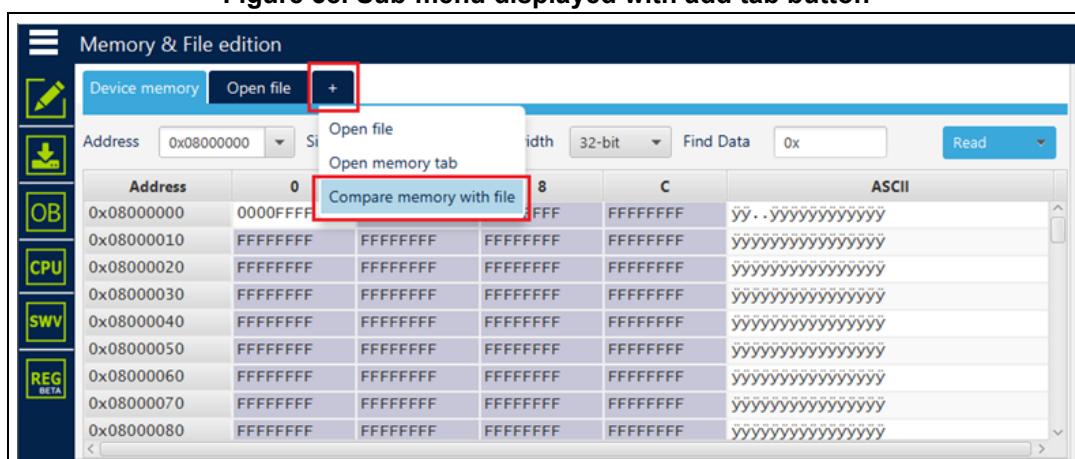

Figure 59. Sub-menu displayed with right click on the opened file tab

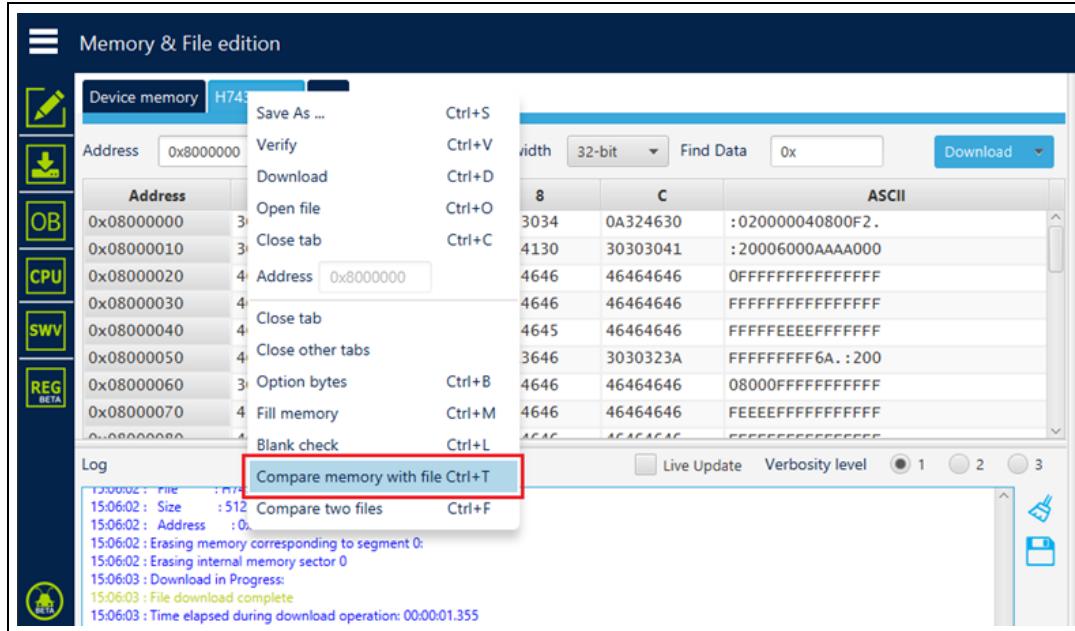

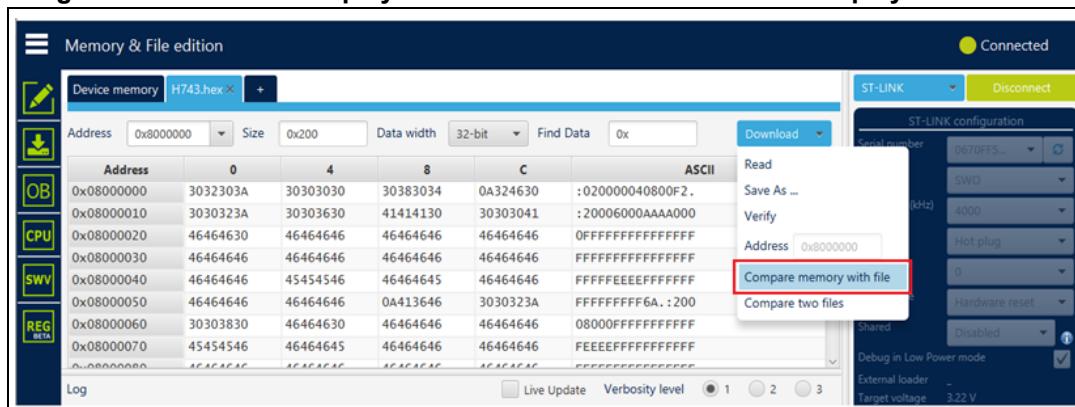

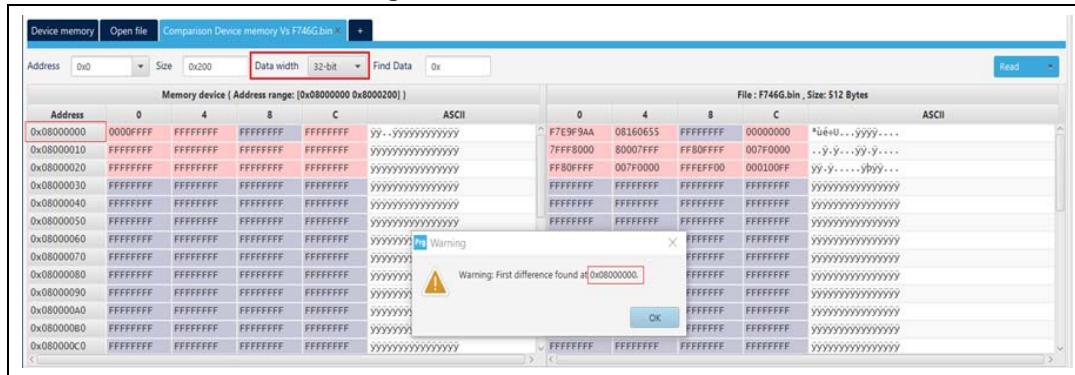

Figure 60. Sub-menu displayed from “Download” combo-box displayed in file tab

**Note:**

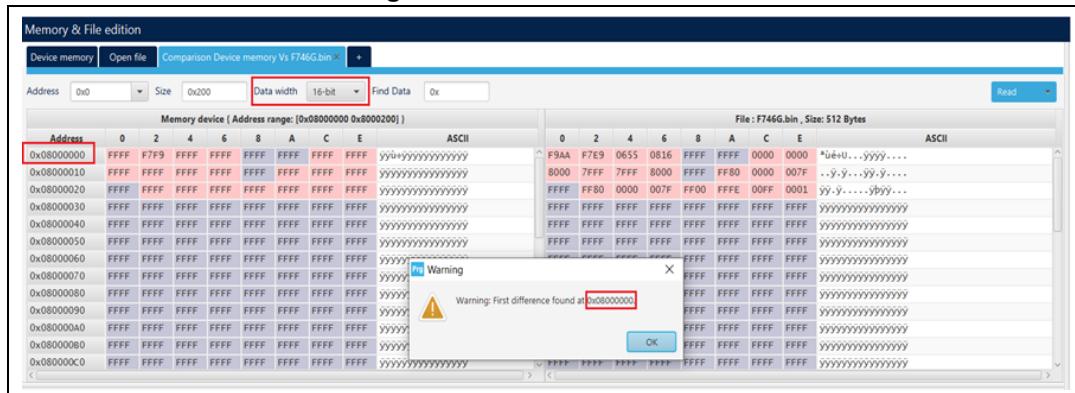

*In addition to sub-menus to display this window, the user can launch the operation directly by using the key combination Ctrl+T.*

### **Example 1: Difference between internal Flash memory and binary file**

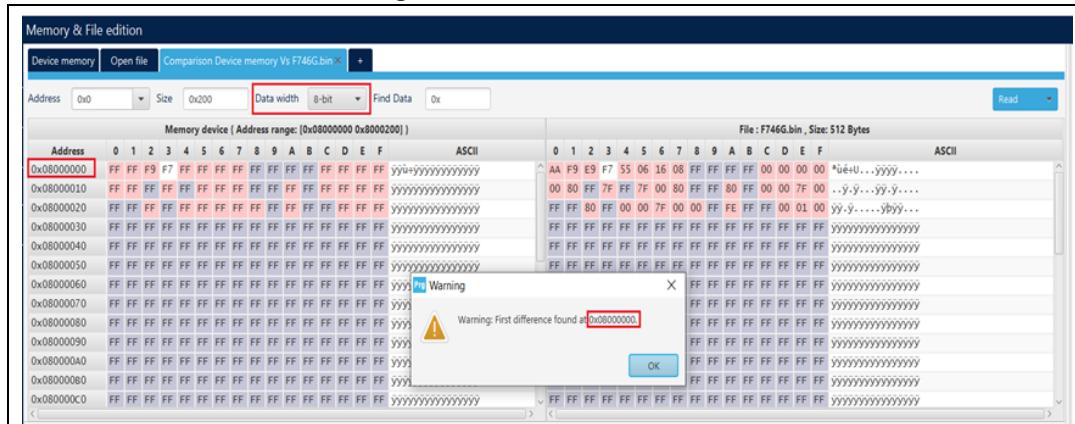

**Figure 61. Data width: 32 bits**

**Figure 62. Data width: 16 bits**

**Figure 63. Data width: 8 bits**

### Example 2: Difference between external Flash memory and hex file

Figure 64. Data width: 32 bits

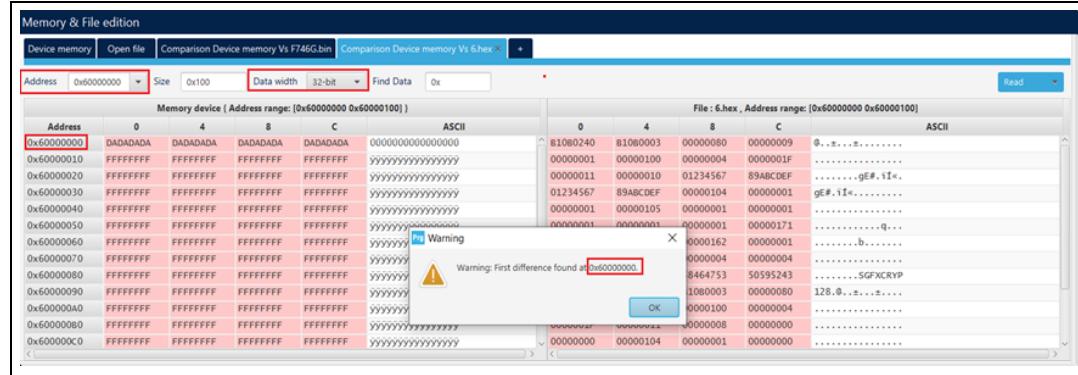

Figure 65. Data width: 16 bits

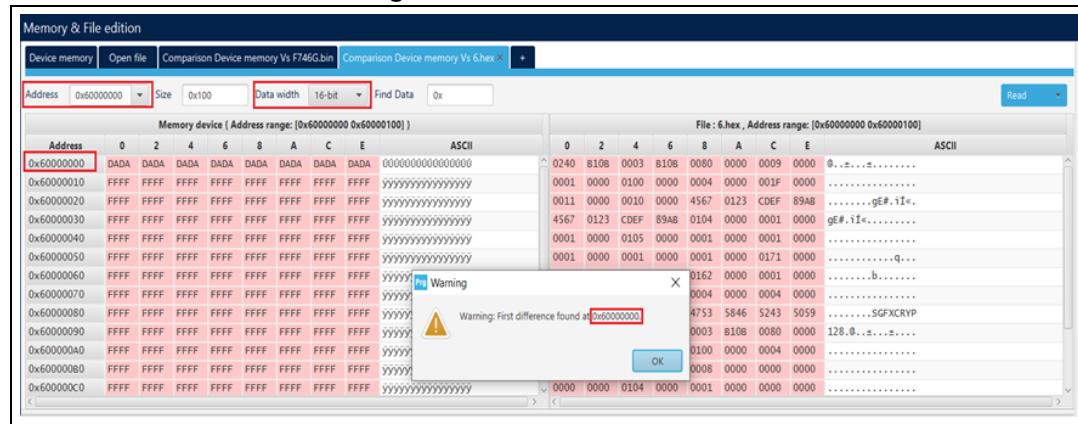

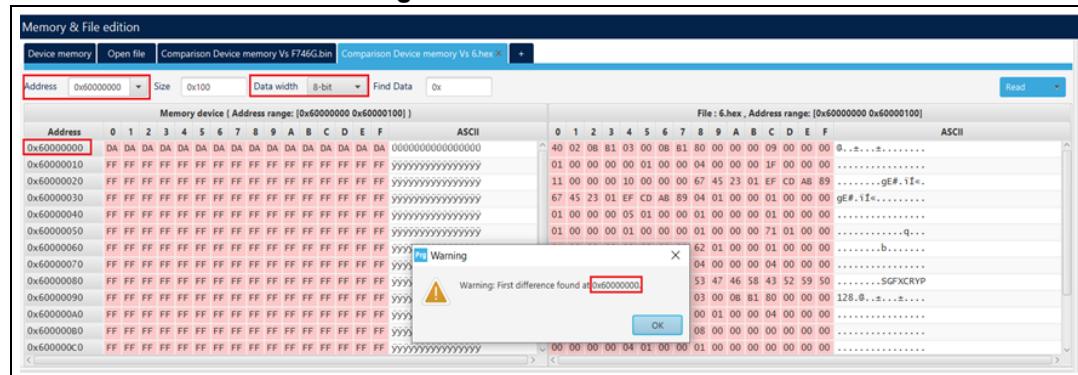

Figure 66. Data width: 8 bits

After launching the comparison between the Flash memory and file, and the edit of data in the memory, the user must make an update in the comparison tab using the read button.

### Example 3: Update comparison between Flash memory and file after editing

Note:

The user can make multiple comparisons between Flash memory and files.

Figure 69. Multiple comparisons

## 2.19 Comparison between two files

**Description:** Compares the content of two different files (binary, hex, srec, elf, out and axf). The difference is colored in red in the grid panel of each file.

This operation does not need a connected board.

The used files can be of different sizes and types.

The user can open the comparison window from different sub-menus.

Figure 70. Sub-menu displayed from “Read” combo-box in device memory tab

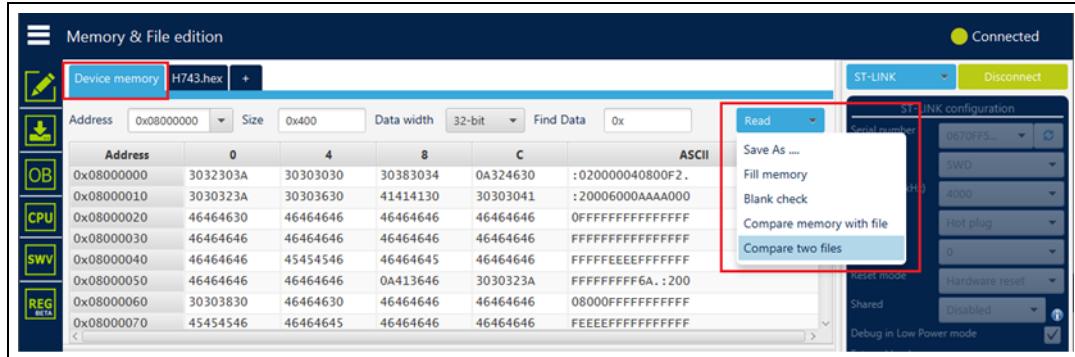

Figure 71. Sub-menu displayed with right click on “Device memory” tab

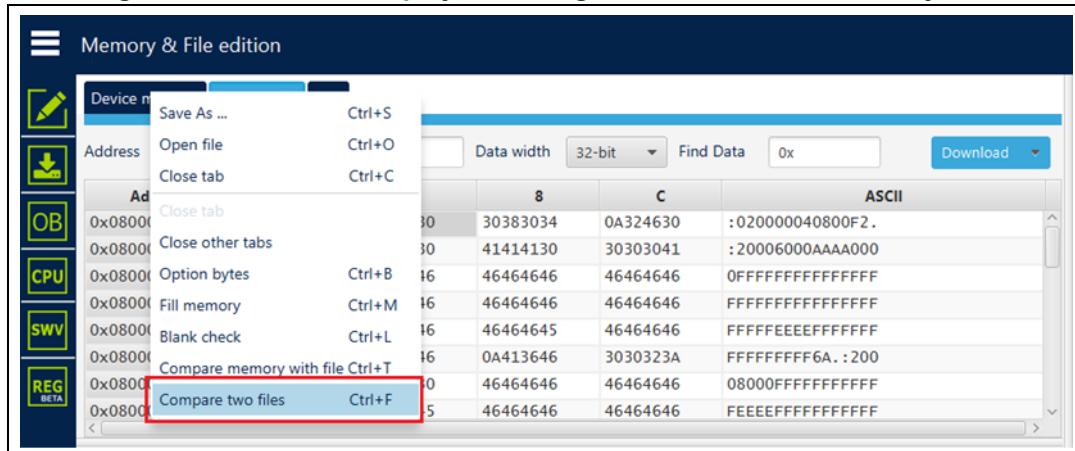

Figure 72. Sub-menu displayed with right click on the cell of grid

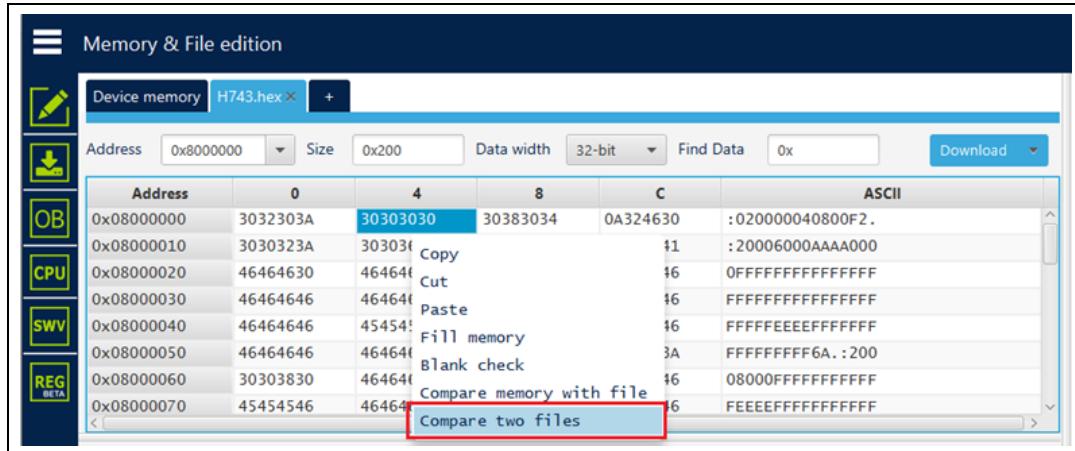

Figure 73. Sub-menu displayed with add tab button

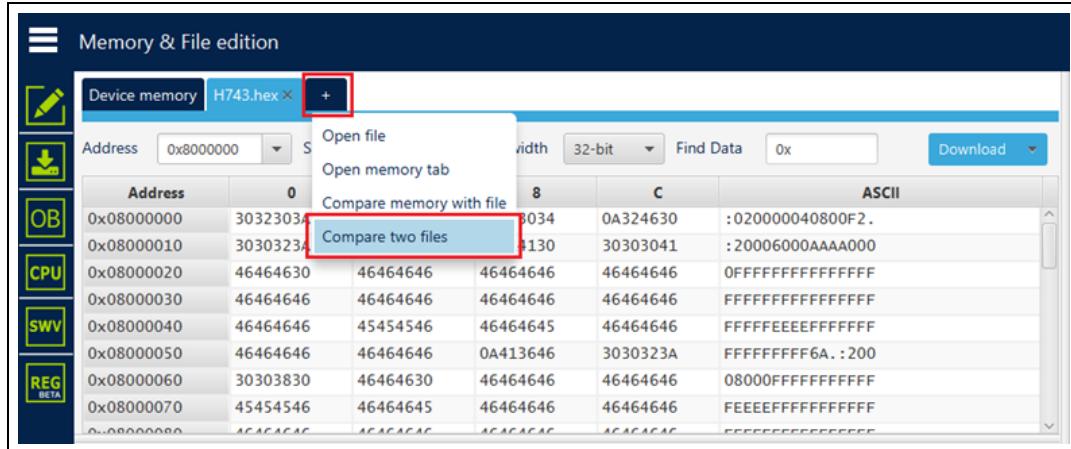

Figure 74. Sub-menu displayed with right click on the opened file tab

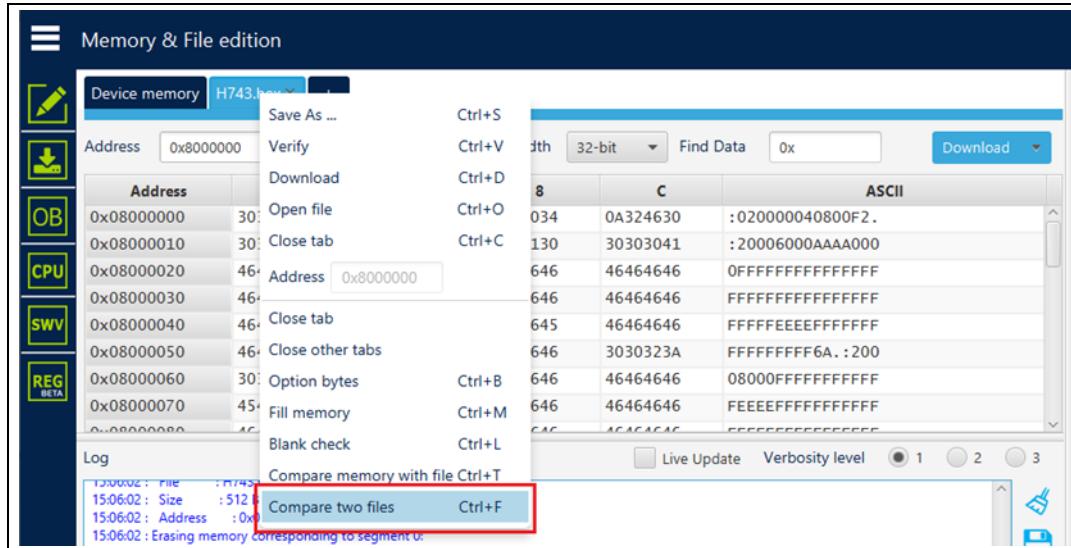

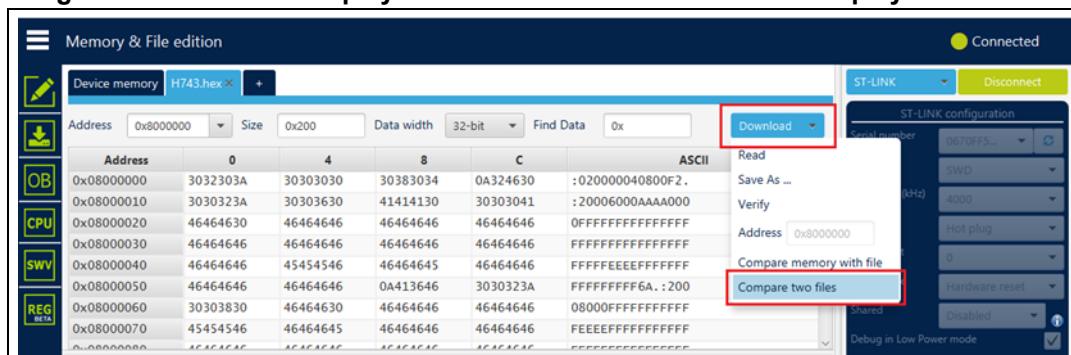

Figure 75. Sub-menu displayed from “Download” combo-box displayed in file tab

**Note:**

In addition to sub-menus to display this window, the user can open it directly by using the key combination **Ctrl+F**.

### Example: Difference between two files with same type and different sizes

Figure 76. Data width: 32 bits

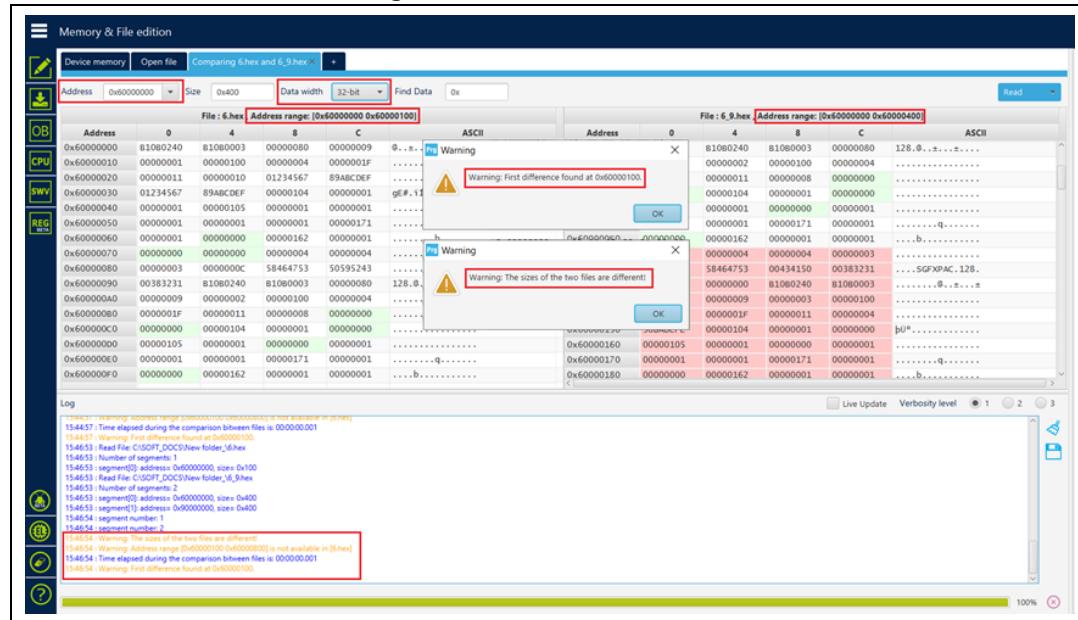

Figure 77. Data width: 16 bits

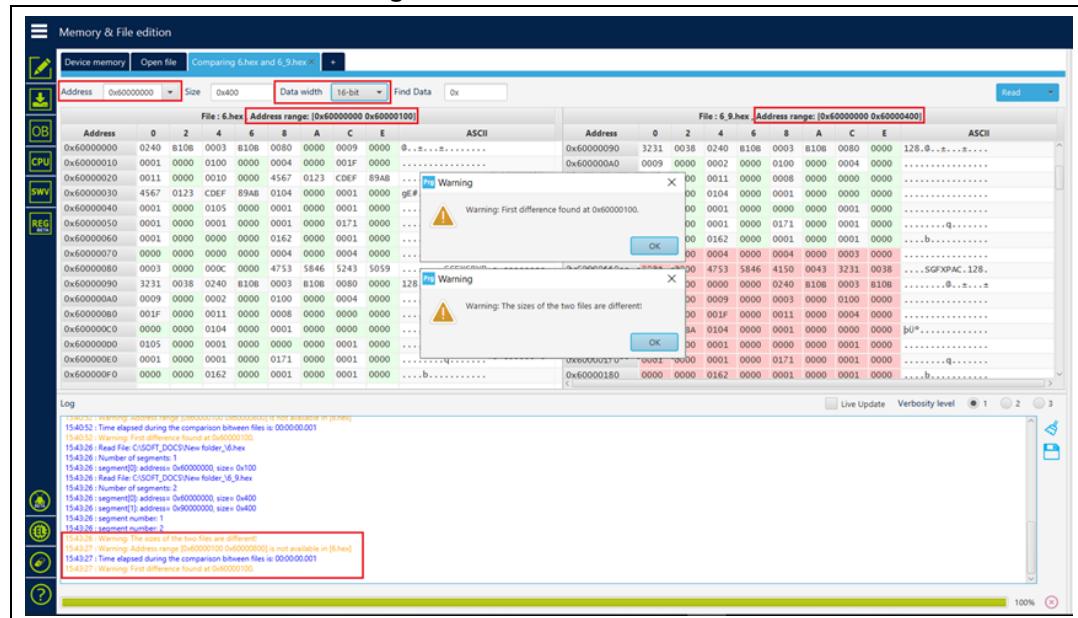

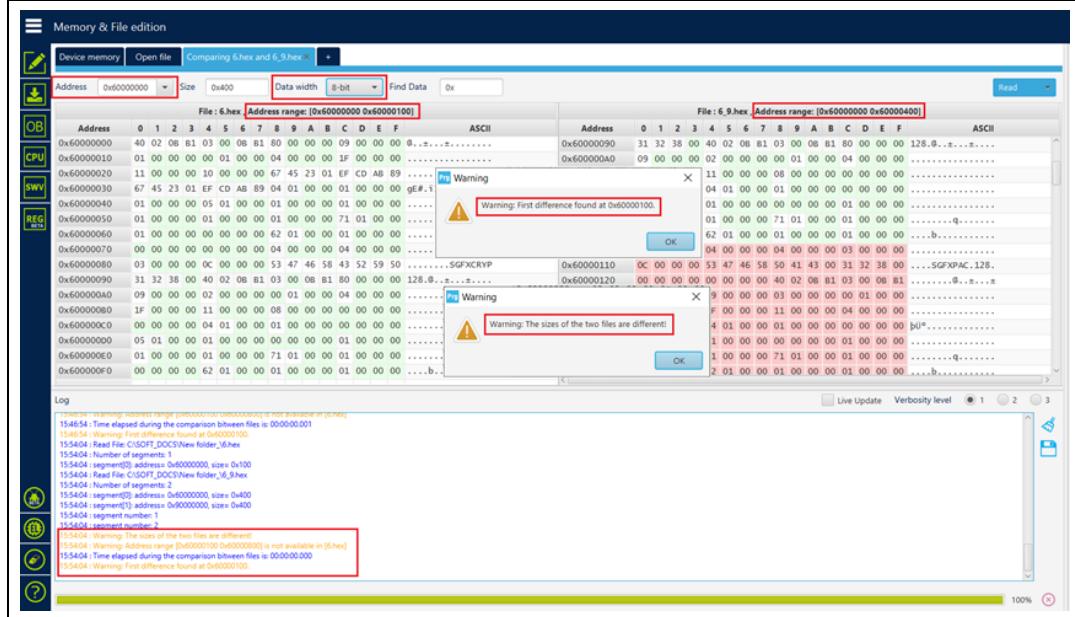

Figure 78. Data width: 8 bits

Note: The user can make multiple comparisons between files.

Figure 79. Multiple comparisons

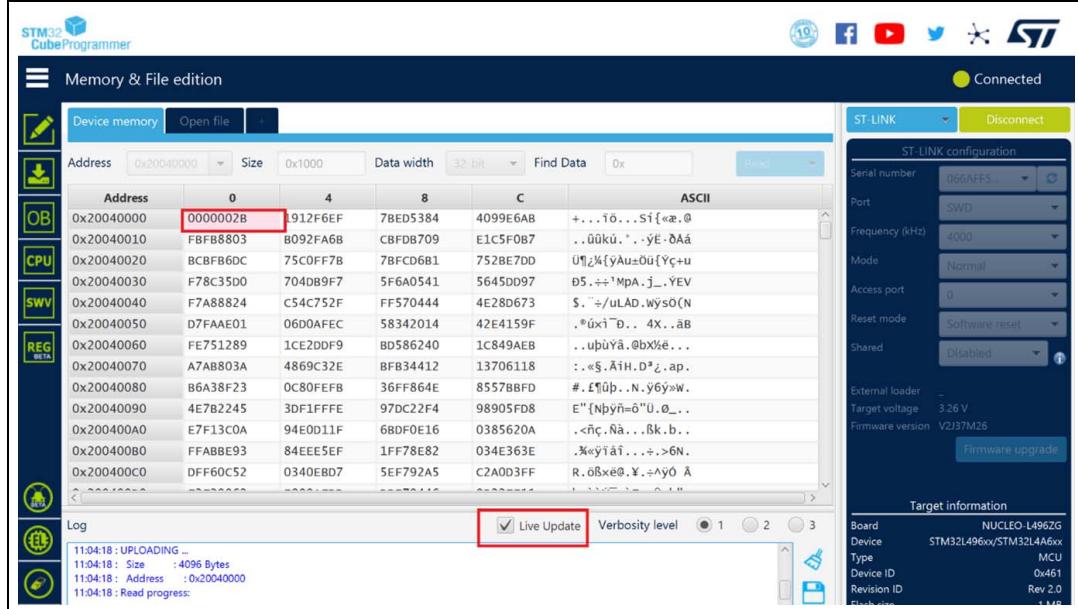

## 2.20 LiveUpdate feature

### -liveUpdate checkbox

**Description:** When this feature is used the device memory grid is updated in real time and the modified data are colored in pink.

Once the device is connected, user can check the liveUpdate checkbox, memory data are updated in real time.

Figure 80. Live update of data

## 3 STM32CubeProgrammer command line interface (CLI) for MCUs

### 3.1 Command line usage

The following sections describe how to use the STM32CubeProgrammer from the command line. Available commands are shown in [Figure 81](#).

*Note:* *To launch command line interface on macOS, call*  
*STM32CubeProgrammer.app/Contents/MacOs/bin/STM32\_Programmer\_CLI.*

Figure 81. STM32CubeProgrammer: available commands

```

Usage :
STM32_Programmer_CLI.exe [command_1] [Arguments_1][[command_2] [Arguments_2]...]
```

**Generic commands:**

- ?, -h, --help : Show this help
- version, --version : Displays the tool's version
- l, --list : List all available communication interfaces
- <uart> : USART interface
- <usb> : USB interface
- q, --quietMode : Enable quiet mode. No progress bar displayed
- log, --log [<file\_Path.log>] : Store the detailed output in log file
- ub, --verbosity [<Level>] : Specify verbosity level
- ns, --mergesbsfu : Add a binary header and a sbsfu segment to an elf file

**Available commands for STM32 MCU**

- skipErase : Skip sector erase before programming
- sl, --safeLib : Add a segment into a firmware file (.elf,.bin hex,.sec) containing computed CRC values
- <file\_path> : File path to be modified
- <start\_address> : Flash memory start address
- <end\_address> : Flash memory end address
- <slice\_size> : Size of data per CRC value
- ns, --mergesbsfu : Add a binary header and a sbsfu segment to an elf file
- <elf\_file\_path> : File path to be modified
- <header\_file\_path> : Header file path
- <sbsfu\_file\_path> : SBSFU file path
- c, --connect [<port=>PortName] : Establish connection to the device
- <uart> : Interface identifier. ex COM1, /dev/ttyS0, usbi, JTAG, SWD...
- UART port optional parameters:
- [baudrate<val>] : Baudrate, ex: 115200, 9600, etc, default 115200
- [P<parity>] : Parity bit, value in {NONE,ODD,EVEN}, default EVEN
- [db<data\_bits>] : Data bit, value in {6, 7, 8} .... default 8
- [sh<stop\_bits>] : Stop bit, value in {1, 1.5, 2} .... default 1
- [fc<flowControl>] : Flow control, value in {None, XON/XOFF, Hardware, Software} .... default OFF
- [ininit=>noinit\_bit] : Not supported for STM32MP
- [console] : Set No Init bits, value in {0,1} .... default 0
- JTAG/SWD debug port optional parameters:
- [freq=>frequency] : Frequency in MHz. Default frequencies: 4000 SWD 9000 JTAG with STLINKv2 240000 SWD 21333 with STLINKv3
- [index=>index] : Index of the debug probe, default index 0
- [sn=>serialNumber] : Serial Number of the debug probe
- [ap=>AccessPort] : Access Port index to connect to, default ap 0
- [mode=>mode] : Connection mode. Value in {UR/HOTPLUG/NORMAL} default mode: NORMAL
- [reset=>node] : Reset modes: SWrst/Wrst/Grst. Default mode: SWrst
- SPI port optional parameters:
- [br=>baudrate] : Baudrate.
- [cpba=>cpha\_val] : 1Edge or 2Edge. default 1Edge
- [cpol=>cpco\_val] : Low or high.
- [tosc=>tosc\_val] : Oscillator disable <0/1>.
- [crcpol=>crc\_pol] : crc polynomial value.
- [datasize=>size] : 8bit/16bit
- [direction=>val] : Direction: 2LFULLDuplex/2LRxOnly/1LRx/1LTx
- [firstbit=>val] : First bit: MSB or LSB
- [frmt=>format] : Frame Format: Motorola/TI
- [mode=>val] : Mode: master/slave
- [nss=>val] : NSS: soft/hard
- [nspulse=>val] : NSS pulse: Pulse/NoPulse
- [tlen=>val] : Transfer length: Nibble/Byte/Memory
- [ininit=>noinit\_bit] : Set No Init bits, value in {0,1} .... default 0
- CAN port optional parameters:
- [br=>rbaudrate] : Baudrate : 125, 250, 500, 1000 Kbps, default 125
- [mode=>canmode] : CAN Mode : CAN1/2/ISO11898/EXTENDED, default CAN1
- [bitrate<val>] : CAN Baudrate, default 1000000
- [cm=>type] : CAN type : STANDARD / EXTENDED, default STANDARD
- [itr=>format] : Frame Format: DATA or REMOTE, default DATA
- [fifo=>afifo] : Msg Receive : FIFO0 or FIFO1, default FIFO0
- [fm=>fnode] : Filter Mode : MASK or LIST, default MASK
- [fr=>filter] : Filter ID: 0 to 255, default 0
- [fe=>enable] : Filter Activation : ENABLE or DISABLE, default ENABLE
- [fbn=>banknb] : Filter Bank Number : 0 to 13, default 0
- [ininit=>noinit\_bit] : Set No Init bits, value in {0,1} .... default 0
- I2C port optional parameters:
- [baudrate<val>] : I2C address : address in hex format
- [br=>sbaudrate] : Baudrate : 100 or 400 Kbps, default 400
- [sm=>snode] : Speed Mode : STANDARD or FAST, default FAST
- [an=>addrmode] : Address Mode : ? or 10 bits, default ?
- [ad=>addr] : Address : 0 to 127, default 0
- [df=>dfilter] : Digital filter :ENABLE or DISABLE, default ENABLE
- [dnf=>dfilter] : Digital noise filter : 0 to 15, default 0
- [rt=>rtime] : Rise time : 0-1000(STANDARD), 0-300(FAST), default 0
- [ft=>ftime] : Fall time : 0-1000 (STANDARD), 0-300 (FAST), default 0
- [ininit=>noinit\_bit] : Set No Init bits, value in {0,1} .... default 0
- e, --erase : Erase memory pages/sectors/devices:
- [all] : Erase all sectors
- [<sectorCodes>] : Erase specific sectors identified by sectors codes. ex: 0, 1, 2 to erase sectors 0, 1 and 2
- [<start end>] : Erase the specified sectors starting from start code to end code, ex: -e 15 18]
- u, --write : Download the content of a file into device memory
- d, --download [<file\_path>] : File path name to be downloaded: (.bin, hex, trec, elf, stm32 or tsv file)
- [<address>] : Start address of download
- u32 [<address> <32-bit\_data>] : Write 32-bit data into device memory
- [<address> <32-bit\_data>] : 32-bit data to be downloaded
- v, --verify : Verify if the programming operation is achieved
- r32 [<address> <size>] : Read a 32-bit data from device memory
- rst : Reset system
- hardRst : Hard Reset
- score : Get core status
- coreReg [<core\_register>] : Read/Write core registers
- [<core\_reg=>value] : Read/Write core register
- [<core\_register>] : PRIMASK/BASEPRI/MULTIPLICATOR/CONTROL
- [<core\_reg=>value] : value in case of write operation
- Note: multiple registers can be handled at once
- Available only with JTAG/SWD debug port
- r, --read : Read memory content
- u, --upload [<address> <size> <file\_path>] : Upload the device memory content to a .bin file
- [<address> <size> <file\_path>] : Start address of read and upload
- [<address> <size> <file\_path>] : Size of memory content to be read
- [<address> <size> <file\_path>] : Binary file path
- el, --extload [<file\_path>] : Select a custom external memory-loader
- [<file\_path>] : External memory-loader file path
- s, --start [<address>] : Run the code at the specified address.
- g, --go [<address>] : Start address
- rdw, --readupprotect : Remove memory's Read Protection by shifting the RDP level from level 1 to level 0.
- ob, --optionbytes : This command allows the user to manipulate the device's OptionBytes by displaying or modifying them.
- [displ] : This option allows the user to display the whole set of Option Bytes.
- [OptByte=>value] : This option allows the user to program the given Option Byte.

## 3.2 Generic commands

This section presents the set of commands supported by all STM32 MCUs.

### 3.2.1 Connect command

#### -c, --connect

**Description:** Establishes the connection to the device. This command allows the host to open the chosen device port (UART/USB/JTAG/SWD/SPI/CAN/I2C).

**Syntax:** `-c port=<Portname> [noinit=<noinit_bit>] [options]`

**port=<Portname>** Interface identifier, ex COMx (for Windows), /dev/ttySx for Linux), usbx for USB interface, SPI, I2C and CAN for, respectively, SPI, I2C and CAN interfaces.

**[noinit=<noinit\_bit>]** Set No Init bits, value in {0, 1} ..., default 0. Noinit = 1 can be used if a previous connection is usually active.

- ST-LINK options

**[freq=<frequency>]** Frequency in kHz used in connection. Default value is 4000 kHz for SWD port, and 9000 kHz for JTAG port

**Note:** *The entered frequency values are rounded to correspond to those supported by ST-LINK probe.*

**[index=<index>]** Index of the debug probe. Default index value is 0.

**[sn=<serialNumber>]** Serial number of the debug probe. Use this option if you need to connect to a specific ST-LINK probe of which you know the serial number. Do not use this option with Index option in the same connect command.

**[mode=<mode>]** Connection mode. Value in {NORMAL/UR/HOTPLUG}. Default value is NORMAL.

**Normal** With 'Normal' connection mode, the target is reset then halted. The type of reset is selected using the 'Reset Mode' option.

**UR** The 'Connect Under Reset' mode enables connection to the target using a reset vector catch before executing any instructions. This is useful in many cases, for example when the target contains a code that disables the JTAG/SWD pins.

**HOTPLUG** The 'Hot Plug' mode enables connection to the target without a halt or reset. This is useful for updating the RAM addresses or the IP registers while the application is running.

**[ap=<accessPort>]** Access port index. Default access port value is 0.

**[speed=]** Connection speed. Default is Reliable.  
Available only for Cortex-M33.

**Reliable** Allows the user to connect with a slow mode.

|                               |  |
|-------------------------------|--|
| <b>Fast</b>                   | Allows the user to connect with a fast mode.   |
| <b>[shared]</b>               | Enables shared mode allowing connection of two or more instances of STM32CubeProgrammer or other debugger to the same ST-LINK probe. |
| <b>[tcpport=&lt;Port&gt;]</b> | Selects the TCP Port to connect to an ST-Link Server. Shared option must be selected. Default value is 7184.                         |
| <b>[dLPM / LPM]</b>           | Disable / enable the debug in Low Power mode (default configuration is enabled for the supported devices (STM32U5/ WB/L4 Series).    |

**Note:** *Shared mode is supported only on Windows.*

- USB options

The connection under the DFU interface supports two options, namely product and vendor ID (default values PID=0xDF11, VID=0x0483).

- SPI options

**[br=<baudrate>]** Baudrate (e.g. 187, 375, 750), default 375

**Note:** *To use SPI on high speed, an infrastructure hardware must be respected to ensure the proper connection on the bus.*

|                                  |                                    |
|----------------------------------|------------------------------------|
| <b>[cpha=&lt;cpha_val&gt;]</b>   | 1Edge or 2Edge, default 1Edge      |
| <b>[cpol=&lt;cpol_val&gt;]</b>   | Low or high, default low           |
| <b>[crc=&lt;crc_val&gt;]</b>     | Enable or disable (0/1), default 0 |
| <b>[crcpol=&lt;crc_pol&gt;]</b>  | CRC polynomial value               |
| <b>[datasize=&lt;size&gt;]</b>   | 8- or 16-bit, default 8-bit        |
| <b>[direction=&lt;val&gt;]</b>   | 2LFULLDuplex/2LRxOnly/1LRx/1LTx    |
| <b>[firstbit=&lt;val&gt;]</b>    | MSB/LSB, default MSB               |
| <b>[frameformat=&lt;val&gt;]</b> | Motorola/TI, default Motorola      |
| <b>[mode=&lt;val&gt;]</b>        | Master/slave, default master       |
| <b>[nss=&lt;val&gt;]</b>         | Soft/hard, default hard            |
| <b>[nsspulse=&lt;val&gt;]</b>    | Pulse/NoPulse, default Pulse       |
| <b>[delay=&lt;val&gt;]</b>       | Delay/NoDelay, default Delay       |

- I2C options

**[add=<ownadd>]** Slave address: address in hex format

**Note:** *I2C address option must be always inserted, otherwise the connection is not established.*

**[br=<sbaudrate>]** Baudrate: 100 or 400 Kbps, default 400 Kbps.

**[sm=<smode>]** Speed Mode, STANDARD or FAST, default FAST.

**[am=<addmode>]** Address Mode: 7 or 10 bits, default 7.

**[af=<afilter>]** Analog filter: ENABLE or DISABLE, default ENABLE.

[**df=<dfilter>**] Digital filter: ENABLE or DISABLE, default DISABLE.

[**dnf=<dnfilter>**] Digital noise filter: 0 to 15, default 0.

[**rt=<rtime>**] Rise time: 0-1000 (STANDARD), 0-300 (FAST), default 0.

[**ft=<ftime>**] Fall time: 0-300 (STANDARD), 0-300 (FAST), default 0.

- CAN options

[**br=<rbaudrate>**] Baudrate: 125, 250..., default 125.

[**mode=<canmode>**] Mode: NORMAL, LOOPBACK..., default NORMAL.

**Note:** *The software must request the hardware to enter Normal mode to synchronize on the CAN bus and start reception and transmission between the Host and the CAN device. Normal mode is recommended.*

[**ide=<type>**] Type: STANDARD or EXTENDED, default STANDARD

[**rtr=<format>**] Frame format: DATA or REMOTE, default DATA

[**fifo=<afifo>**] Assigned FIFO: FIFO0 or FIFO1, default FIFO0

[**fm=<emode>**] Filter mode MASK or LIST, default MASK

[**fs=<fscaler>**] Filter scale: 16 or 32, default 32

[**fe=<fenable>**] Activation: ENABLE or DISABLE, default ENABLE

[**fbn=<fbanknb>**] Filter bank number: 0 to 13, default 0

- Using UART

```
./STM32_Programmer.sh -c port=/dev/ttyS0 br=115200
```

The result of this example is shown in [Figure 82](#).

**Figure 82. Connect operation using RS232**

```
$ ./STM32_Programmer.sh -c port=/dev/ttyS0 br=115200
Serial Port /dev/ttyS0 is successfully opened.
Port configuration: parity = none, baudrate = 115200, data-bit = 8,
stop-bit = 1.0, flow-control = off
Activating device: OK
Chip ID: 0x500
Bootloader version: 3.1
```

STM32CubeProgrammer provides the possibility to configure RTS and DTR pins:

- RTS, used as follows: rts=low
- DTR, used as follows: dtr=high

Example: STM32\_Programmer\_CLI.exe -c port=COM27 dtr=high (see [Figure 83](#)).

Figure 83. Enabling COM DTR pin

```
Serial Port COM27 is successfully opened.  
Port configuration: parity = even, baudrate = 115200, data-bit = 8,  
stop-bit = 1.0, flow-control = off  
  
Timeout error occurred while waiting for acknowledgement.  
Activating device: OK  
Chip ID: 0x421  
BootLoader protocol version: 3.1  
Device name : STM32F446xx  
Flash size  : 512 KBytes (default)  
Device type : MCU  
Device CPU  : Cortex-M4  
Dtr: High
```

### Example using USB

```
./STM32_Programmer.sh -c port=usb1
```

The result of this example is shown in *Figure 84*.

**Figure 84. Connect operation using USB**

| establishing connection with the target device |          |             |         |      |  |
|--|----------|-------------|---------|------|--|
| AREA NAME                                      | SECT.NBR | ADDRESS     | SIZE    | TYPE |  |
| Internal Flash                                 | 0000     | 0x08000000  | 0016 KB | REW  |  |
|  | 0001     | 0x08004000  | 0016 KB | REW  |  |

|  | 0003     | 0x0800c000  | 0016 KB | REW  |  |
|  | 0004     | 0x08010000  | 0064 KB | REW  |  |
|  | 0005     | 0x08020000  | 0128 KB | REW  |  |
|  | 0006     | 0x08040000  | 0128 KB | REW  |  |
|  | 0007     | 0x08060000  | 0128 KB | REW  |  |
|  | 0008     | 0x08080000  | 0128 KB | REW  |  |
|  | 0009     | 0x080a0000  | 0128 KB | REW  |  |
|  | 0010     | 0x080c0000  | 0128 KB | REW  |  |
|  | 0011     | 0x080e0000  | 0128 KB | REW  |  |
|  | 0012     | 0x08100000  | 0016 KB | REW  |  |
|  | 0013     | 0x08104000  | 0016 KB | REW  |  |
|  | 0014     | 0x08108000  | 0016 KB | REW  |  |
|  | 0015     | 0x0810c000  | 0016 KB | REW  |  |
|  | 0016     | 0x08110000  | 0064 KB | REW  |  |
|  | 0017     | 0x08120000  | 0128 KB | REW  |  |
|  | 0018     | 0x08140000  | 0128 KB | REW  |  |
|  | 0019     | 0x08160000  | 0128 KB | REW  |  |
|  | 0020     | 0x08180000  | 0128 KB | REW  |  |
|  | 0021     | 0x081a0000  | 0128 KB | REW  |  |
|  | 0022     | 0x081c0000  | 0128 KB | REW  |  |
|  | 0023     | 0x081e0000  | 0128 KB | REW  |  |
| Option Bytes                                   | 0000     | 0x1fffec000 | 0016 B  | RW   |  |
|  | 0001     | 0x1fffec000 | 0016 B  | RW   |  |
| OPI Memory                                     | 0000     | 0x1fff7800  | 0512 B  | RW   |  |
|  | 0001     | 0x1fff7a00  | 0016 B  | RW   |  |
| Device Feature                                 | 0000     | 0xfffff0000 | 0004 B  | RW   |  |

**Note:**

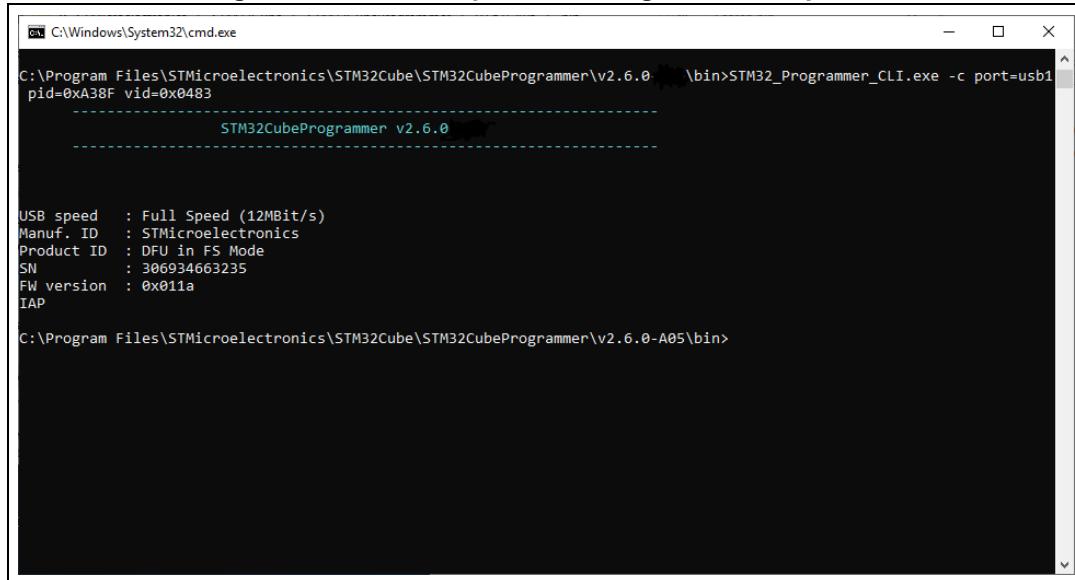

When using a USB interface, all the configuration parameters (e.g. baud rate, parity, data-bits, frequency, index) are ignored. To connect using a UART interface the port configuration (baudrate, parity, data-bits, stopbits and flow-control) must have a valid combination, depending on the used device.

### Example using DFU IAP/USBx options

`/STM32_Programmer.sh -c port=usb1 pid=0xA38F vid=0x0438`

The result of this example is shown in *Figure 85*.

**Figure 85. Connect operation using USB DFU options**

```
C:\Windows\System32\cmd.exe
C:\Program Files\STMicroelectronics\STM32Cube\STM32CubeProgrammer\v2.6.0\bin>STM32_Programmer_CLI.exe -c port=usb1
pid=0xA38F vid=0x0438
-----
STM32CubeProgrammer v2.6.0
-----

USB speed : Full Speed (12MBit/s)
Manuf. ID : STMicroelectronics
Product ID : DFU in FS Mode
SN : 306934663235
FW version : 0x011a
IAP

C:\Program Files\STMicroelectronics\STM32Cube\STM32CubeProgrammer\v2.6.0-A05\bin>
```

**Note:** The default value of product ID and vendor ID are ST products values (PID=0xDF11, VID=0x0483).

### Example using JTAG/SWD debug port

To connect using port connection mode with ST-LINK probe it is necessary to mention the port name with at least the connect command (for example: `-c port=JTAG`).

**Note:** Make sure that the device being used contains a JTAG debug port when trying to connect through the JTAG.

There are other parameters used in connection with JTAG/SWD debug ports that have default values (see the Help menu of the tool for more information about default values).

The example below shows a connection example with an STM32 with device ID 0x415.

**Figure 86. Connect operation using SWD debug port**

```
ST-LINK SN : 066BFF574857847167114941
ST-LINK FW : U2J30M20
Voltage : 3.25V
SWD freq : 4000 KHz
Connect mode: Normal
Reset mode : Software reset
Device ID : 0x415
Device name : STM32L4x1/STM32L475xx/STM32L476xx/STM32L486xx
Device type : MCU
Device CPU : Cortex-M4
```

The corresponding command line for this example is `-c port=SWD freq=3900 ap=0`

In the connect command (`-c port=SWD freq=3900 ap=0`)

- The `<port>` parameter is mandatory.
- The index is not mentioned in the command line. The `Index` parameter takes the default value 0.
- The frequency entered is 3900 kHz, however the connection is established with 4000 kHz. This is due to the fact that ST-LINK probe has fixed values with SWD and JTAG debug ports.
- ST-LINK v2/v2.1
  - SWD (4000, 1800, 950, 480, 240, 125, 100, 50, 25, 15, 5) kHz
  - JTAG (9000, 4500, 2250, 1125, 562, 281, 140) kHz
- ST-LINK v3
  - SWD (24000, 8000, 3300, 1000, 200, 50, 5)
  - JTAG (21333, 16000, 12000, 8000, 1777, 750)

If the value entered does not correspond to any of these values, the next highest one is considered. Default frequency values are:

- SWD: STLinkV2: 4000 kHz, STLinkV3: 24000 kHz
- JTAG: STLinkV2: 9000 kHz, STLinkV3: 21333 kHz

**Note:** *JTAG frequency selection is only supported with ST-LINK firmware versions from V2J23 onward.*

*To connect to access port 0 the `ap` parameter is used in this example, so any command used after the connect command is established through the selected access port.*

**Note:** *The ST-LINK probe firmware version is shown when connecting to the device. Make sure that you have the latest version of ST-LINK firmware V2J28M17 (STSW-LINK007), available on [www.st.com](http://www.st.com).*

### Example using SPI

```
STM32_Programmer_CLI -c port=SPI br=375 cpha=1edge cpol=low
```

The result of this example is shown in [Figure 87](#).

**Figure 87. Connect operation using SPI port**

```
ST-LINK FW : U3J1M1
Voltage   : 0.00V
Bridge freq : 48000 KHz
Baudrate  : 375 KHz
BL version : 1.1
Device ID  : 0x462
Device name : STM32L45x
Device type : MCU
Device CPU  : Cortex-M4
```

**Note:** Make sure that the device being used supports a SPI bootloader when trying to connect through the SPI.

There are other parameters used in connection with SPI port that have default values, and some others must have specific values (see the help menu of the tool for more information).

### Example using CAN

```
STM32_Programmer_CLI -c port=CAN br=125 fifo=fifo0 fm=mask fs=32
fe=enable fbn=2
```

The result of this example is shown in [Figure 88](#).

**Figure 88. Connect operation using CAN port**

```
ST-LINK FW : U3J1M1
Voltage   : 0.00V
Bridge Freq : 48000 KHz
Baudrate  : 125 Kbps

BL version : 2.0
Device ID  : 0x419
Device name : STM32F42xxx/F43xxx
Device type : MCU
Device CPU  : Cortex-M4
```

**Note:** Not all devices implement this feature, make sure the one you are using supports a CAN bootloader.

There are other parameters used in connection with CAN port that have default values and some others must have specific values (see the help menu of the tool for more information).

### Example using I2C

```
STM32_Programmer_CLI -c port=I2C add=0x38 br=400 sm=fast
```

In the connect command:

- The parameter <add> changes from a device to another, refer to AN2606 to extract the correct one. In this case, the STM32F42xxx has a bootloader address equal to 0x38.
- The baudrate parameter <br> depends directly on the speed mode parameter <sm>, for example, if sm=standard then the baudrate does not support the value 400.

The result of this example is shown in *Figure 89*.

**Figure 89. Connect operation using I2C port**

|             |   |                    |
|-------------|---|--------------------|
| ST-LINK FW  | : | U3J1M1             |
| Voltage     | : | 0.00V              |
| Bridge freq | : | 192000 KHz         |
| Baudrate    | : | 400 KHz            |
| BL version  | : | 1.1                |
| Device ID   | : | 0x419              |
| Device name | : | STM32F42xxx/F43xxx |
| Device type | : | MCU                |
| Device CPU  | : | Cortex-M4          |

**Note:** For each I2C connection operation the address parameter is mandatory.

**Note:** Not all devices implement this feature, make sure that the device supports an I2C bootloader.

There are other parameters used in connection with I2C port that have default values and some others must have specific values (see the help menu of the tool for more information).

**Note:** For the parallel programming of more than one STM32 device using multiple instances of STM32CubeProgrammer, it is mandatory to add the serial number of each device in the suitable instance, as shown in the following example:

- “–c port=swd/usb sn=SN1” (instance 1 of STM32CubeProgrammer)
- “–c port=swd/usb sn=SN2” (instance 2 of STM32CubeProgrammer)
- “–c port=swd/usb sn=SN3” (instance 3 of STM32CubeProgrammer)

### 3.2.2 Erase command

**-e, --erase**

**Description:** According to the given arguments, this command can be used to erase specific sectors or the whole Flash memory. This operation can take a second or more to complete, depending on the involved size.

**Syntax:**

- [**all**] Erase all sectors. EEPROM area is excluded.
- [<**sectorsCodes**>] Erase the sectors identified by codes (e.g. **0,1,2** to erase sectors 0, 1 and 2). For EEPROM: **ed1** & **ed2**.
- [<**start end**>] Erase the specified sectors starting from start code to end code, e.g. **-e [5 10]**.

Example

```
./STM32_Programmer.sh --connect port=/dev/ttys0 -e 2 4
```

This command erases only sectors 2 and 4.

**Note:** *In the case of multiplicity of external loaders, the first selected is the one that will be taken into account during erasing of the external memory.*

### 3.2.3 Download command

**-w, --write, -d, --download**

**Description:** Downloads the content of the specified binary file into device memory. The download operation is preceded by the erase operation before the Flash memory is downloaded. A write address is only needed to download binary files.

**Syntax:** `-w <file_path> [start_address]`

`[file_path]` Path of the file to be downloaded

`[start_address]` Start address of download

Example

```
-c port=COM4 -w RefSMI_MDK/All_Flash_0x1234_256K.bin 0x08008000
```

This command programs the binary file “All\_Flash\_0x1234\_256K.bin” at address 0x08008000.

The result of this example is shown in [Figure 90](#).

**Figure 90. Download operation**

```
Serial Port COM4 is successfully opened.
Port configuration: parity = none, baudrate = 115200, data-bit = 8,
stop-bit = 1.0, flow-control = off
Activating device: OK
Chip ID: 0x450
BootLoader version: 3.1

Memory Programming ...
File : RefSMI_MDK/All_Flash_0x1234_256K.bin
Size : 262144 Bytes
Address : 0x08008000

Download in Progress: 100%
File download complete
Time elapsed during the download operation is: 00:01:06.793
Press <RETURN> to close this window...
```

**Note:** To verify that the download has been successful, call the verify option (-v or –verify) just after the write command, otherwise the verify option is ignored.

### 3.2.4 Download 32-bit data command

**-w32**

**Description:** Downloads the specified 32-bit data into Flash memory starting from a specified address.

**Syntax:** `-w32 <start_address> <32_data_bits>`

**<start\_address>** Start address of download.  
**<32\_data\_Bits>** 32 data bits to be downloaded. Data must be separated by escape.

Example

```
./STM32_Programmer.sh -c port=/dev/ttyS0 br=9600 -w32 0x08000000
0x12345678 0xAABBCCFF 0x12AB34CD -verify
```

*Note:* This command makes it possible to write the 32 data bits (0x12345678, 0xAABBCCFF, 0x12AB34CD) into the Flash memory starting from address 0x08000000.

### 3.2.5 Download 64-bit data command

**-w64**

**Description:** Downloads the specified 64-bit data into a destination address.

**Syntax:** `-w64 <start_address> <64-bit_data>`

**<start\_address>** Start address of download.  
**<64\_data\_Bits>** 64-bit data to be downloaded. Data must be separated by escape.

Example:

```
/STM32_Programmer_CLI.exe -c port=swd -w64 0x08000000 0x12345678AABBCCFF
```

### 3.2.6 Read command

**-r, --read, -u, --upload**

**Description:** Reads and uploads the device memory content into a specified binary file starting from a specified address.

**Syntax:** `--upload <start_address> <size> <file_path>`

**<start\_address>** Start address of read.  
**<size>** Size of memory content to be read.  
**<file\_path>** Binary file path to upload the memory content.

Example

```
./STM32_Programmer.sh -c port=/dev/ttyS0 br=9600 --upload
0x20007000 2000 "/local/benayeh/Binaries/read2000.bin"
```

This command makes it possible to read 2000 bytes, starting from address 0x20007000, and uploads the content to a binary file "/local/benayeh/Binaries/read2000.bin"

**-r32**

**Description:** Read 32-bit data memory.

**Syntax:** `-r32 <start_address> <size>`

<**start\_address**> Start address of read.  
**<size>** Size of memory content to be read.

#### Example

```
./STM32_Programmer.sh -c port=SWD -r32 0x08000000 0x100
```

**Figure 91. Read 32-bit operation**

```
ST-LINK Firmware version : V2J28M17
SWD frequency = 4000K
Connection mode: Normal

```

**Note:** The maximum size allowed with the **-r32** command is 32 Kbytes.

### 3.2.7 Start command

**-g, --go, -s, --start**

**Description:** This command enables execution of the device memory starting from the specified address.

**Syntax:** **--start [start\_address]**

**[start\_address]** Start address of application to be executed.

#### Example

```
./STM32_Programmer.sh --connect port=/dev/ttyS0 br=9600 --start
0x08000000
```

This command runs the code specified at 0x08000000.

### 3.2.8 Debug commands

The following commands are available only with the JTAG/SWD debug port.

**-rst**

**Description:** Executes a software system reset;

**Syntax:** `-rst`

**-hardRst**

**Description:** Generates a hardware reset through the RESET pin in the debug connector.

The RESET pin of the JTAG connector (pin 15) must be connected to the device reset pin.

**Syntax:** `-hardRst`

**-halt**

**Description:** Halts the core.

**Syntax:** `-halt`

**-step**

**Description:** Executes one instruction.

**Syntax:** `-step`

**-score**

**Description:** Displays the Cortex-M core status.

The core status can be one of the following: ‘Running’, ‘Halted’, ‘Locked up’, ‘Reset’, ‘Locked up or Kept under reset’

**Syntax:** `-score`

**-coreReg**

**Description:** Read/write Cortex-M core registers. The core is halted before a read/write operation.

**Syntax:** `-coreReg [<core_register>]`

`R0/. . . /R15/PC/LR/PSP/MSP/XPSR/APSR/IPSR/EPSR/PRIMASK/BASEPRI/  
FAULTMASK/CONTROL`

**[core\_reg=<value>]:** The value to write in the core register for a write operation. Multiple registers can be handled at once.

Example

**-coreReg** This command displays the current values of the core registers.

**-coreReg R0 R8** This command displays the current values of R0 and R8.

**-coreReg R0=5 R8=10** This command modifies the values of R0 and R8.

### 3.2.9 List command

**-l, -list**

**Description:** This command lists all available RS232 serial ports.

**Syntax:** `-l, --list`

Example

```
./STM32_Programmer.sh --list
```

The result of this example is shown in *Figure 92*.

**Figure 92. The available serial ports list**

```
$ ./STM32_Programmer.sh -l

Total number of serial ports available: 2
  Port: ttys4
  Location: /dev/ttys4
  Description: N/A
  Manufacturer: N/A

  Port: ttys0
  Location: /dev/ttys0
  Description: N/A
  Manufacturer: N/A
```

**Note:** This command is not supported with JTAG/SWD debug port.

### 3.2.10 QuietMode command

**-q, --quietMode**

**Description:** This command disables the progress bar display during download and read commands.

**Syntax:** `-q, --quietMode`

**Example**

```
./STM32_Programmer.sh -c port=/dev/ttys0 br=115200 -quietMode -w
binaryPath.bin 0x08000000
```

### 3.2.11 Verbosity command

**-vb, --verbosity**

**Description:** This command makes it possible to display more messages, to be more verbose.

**Syntax:** `-vb <level>`

`<level>` : Verbosity level, value in {1, 2, 3} default value vb=1

**Example**

```
./STM32_Programmer.sh -c port=/dev/ttys0 br=115200 -vb 3
```

The result of this example is shown in [Figure 93](#).

**Figure 93. Verbosity command**

```
$ ./STM32_Programmer.sh -c port=/dev/ttyS0 br=115200 -vb 3
Serial Port /dev/ttyS0 is successfully opened.
Port configuration: parity = none, baudrate = 115200, data-bit = 8,
stop-bit = 1.0, flow-control = off
Sending init command:
byte 0x7F sent successfully to target
Received response from target: 0x79
Activating device: OK
Sending GetID command and its XOR:
byte 0x02 sent successfully to target
byte 0xFD sent successfully to target
Received response from target: 0x79
Received response from target: 0x01050079
Chip ID: 0x500
Sending Get command and its XOR:
byte 0x00 sent successfully to target
byte 0xFF sent successfully to target
Received response from target: 0x79
Received response from target: 0x07
Received response from target: 0x07310001020311213179
BootLoader version: 3.1
```

### 3.2.12 Log command

**-log, --log**

**Description:** This traceability command makes it possible to store the whole traffic (with maximum verbosity level) into a log file.

**Syntax:** `-log [filePath.log]`

**[filePath.log]** Path of log file, default is \$HOME/.STM32CubeProgrammer/trace.log.

Example

```
./STM32_Programmer.sh -c port=/dev/ttyS0 br=115200 -log trace.log
```

The result of this example is shown in [Figure 94](#).

**Figure 94. Log command**

```
$ ./STM32_Programmer.sh -c port=/dev/ttyS0 br=115200 -log trace.log
Log output file: trace.log
Serial Port /dev/ttyS0 is successfully opened.
Port configuration: parity = none, baudrate = 115200, data-bit = 8,
stop-bit = 1.0, flow-control = off
Activating device: OK
Chip ID: 0x500
BootLoader version: 3.1
```

The log file trace.log contains verbose messages, as shown in [Figure 95](#).

**Figure 95. Log file content**

```
16:41:19:345
Log output file: trace.log
16:41:19:368 Serial Port /dev/ttyS0 is successfully opened.
16:41:19:368 Port configuration: parity = none, baudrate = 115200, data-bit = 8,
16:41:19:368 stop-bit = 1.0, flow-control = off
16:41:19:368 Sending init command:
16:41:19:368 byte 0x7F sent successfully to target
16:41:19:369 Received response from target: 0x79
16:41:19:369 Activating device: OK
16:41:19:369 Sending GetID command and its XOR:
16:41:19:369 byte 0x02 sent successfully to target
16:41:19:369 byte 0xFD sent successfully to target
16:41:19:370 Received response from target: 0x79
16:41:19:370 Received response from target: 0x01050079
16:41:19:370 Chip ID: 0x500
16:41:19:370 Sending Get command and its XOR:
16:41:19:370 byte 0x00 sent successfully to target
16:41:19:370 byte 0xFF sent successfully to target
16:41:19:371 Received response from target: 0x79
16:41:19:371 Received response from target: 0x07
16:41:19:371 Received response from target: 0x07310001020311213179
16:41:19:371 BootLoader version: 3.1
```

### 3.2.13 External loader command

#### -el

**Description:** This command allows the path of one or more external memory loaders to be entered, to perform programming, write, erase and read operations with an external memory.

**Syntax:** `-el [externalLoaderFilePath1.stldr]` Absolute path of external loader file.

`-el [externalLoaderFilePath1.stldr]... -el [externalLoaderFilePath10.stldr]` Absolute path of external loader files.

Example 1:

```
./STM32_Programmer.sh -c port=swd -w "file.bin" 0x90000000 -v -el
"/local/user/externalLoaderPath.stldr"
```

Example 2:

```
./STM32_Programmer.sh -c port=swd -e all -el
"/local/user/externalLoaderPath.stldr"
```

Example 3:

```
./STM32_Programmer.sh -c port=swd -w "file.bin" 0x90000000 -v -el
"/local/user/externalLoaderPath1.stldr"
"/local/user/externalLoaderPath2.stldr"
```

**Note:** *This command is only supported with SWD/JTAG ports.*

**Note:** *A maximum of ten external loaders can be used.*

### 3.2.14 External loader command with bootloader interface

**-elbl**

**Description:** This command allows to provide the path of an external memory loader used to perform programming, write, erase and read operations with an external memory using bootloader interface (only in RSS/RSSe context). This command is used only when performing SFIx process.

**Syntax:** `-elbl [externalLoaderFilePath.stldr]` Absolute path of external loader file.

Example 1:

```
>STM32_Programmer_CLI.exe -c port=usb1 -elbl MX25LM51245G_STM32L552E-EVAL-SFIx-BL.stldr -sfi out.sfix hsm=0 license.bin -rsse  
RSSe\L5\enc_signed_RSSe_sfi_jtag.bin
```

**Note:** *This command is only supported with bootloader interface (UART/I2C/SPI/USB).*

#### External loader for SFIx

The external loader for SFIx operation is aligned with the RSSe\_SFI\_CallNsFunction, as a result, all the functions used inside the external loader must have the same signature of this function.

`rsse_sfi_ns_call_t`

rsse\_sfi\_ns\_call\_t description in C coding language :

```
typedef uint32_t (*rsse_sfi_ns_call_t)(void * input_param);
```

As a consequence the implementation of these function inside the external loader must be slightly modified to be synchronized with input parameters.

Example of Sector erase function after modification:

```
KeepInCompilation int SectorErase (uint32_t *params)  
{  
    int result = 0;  
    uint32_t BlockAddr;  
    uint32_t EraseStartAddress = params[0];  
    uint32_t EraseEndAddress = params[1];
```

### 3.2.15 Read unprotect command

**-rdu, --readunprotect**

**Description:** This command removes the memory read protection by changing the RDP level from level 1 to level 0.

**Syntax:** `--readunprotect`

Example

```
./STM32_Programmer.sh -c port=swd -rdu
```

### 3.2.16 TZ regression command

**-tzenreg, --tzenregression**

**Description:** This command removes TrustZone protection by disabling TZEN from 1 to 0.

**Syntax:** `--tzenregression`

Example

```
./STM32_Programmer.sh -c port=usb1 -tzenreg
```

**Note:** *This command is only supported for bootloader interface and MCUs with trusted zone.*

### 3.2.17 Option bytes command

**-ob, --optionbytes**

**Description:** This command allows the user to manipulate the device option bytes by displaying or modifying them.

**Syntax:** `-ob [displ] / -ob [OptByte=<value>]`

`[displ]:` Allows the user to display the whole set of option bytes.

`[OptByte=<value>]:` Allows the user to program the given option byte.

Example

```
./STM32_Programmer.sh -c port=swd -ob rdp=0x0 -ob displ
```

**Note:** *For more information about the device option bytes, refer to the dedicated section in the programming manual and reference manual, both available on [www.st.com](http://www.st.com).*

### 3.2.18 Safety lib command

**-sl, --safelib**

**Description:** This command allows a firmware file to be modified by adding a load area (segment) containing the computed CRC values of the user program.

Supported formats: bin, elf, hex and Srec.

**Syntax:** `-sl <file_path> <start_address> <end_address> <slice_size>`

```
<file_path>      The file path (bin, elf, hex or Srec)
<start_address> Flash memory start address
<end_address>   Flash memory end address
<slice_size>    Size of data per CRC value
```

Example

```
STM32_Programmer_CLI.exe -sl TestCRC.axf 0x8000000 0x8010000 0x400
```

The result is shown in *Figure 96*.

**Figure 96. Safety lib command**

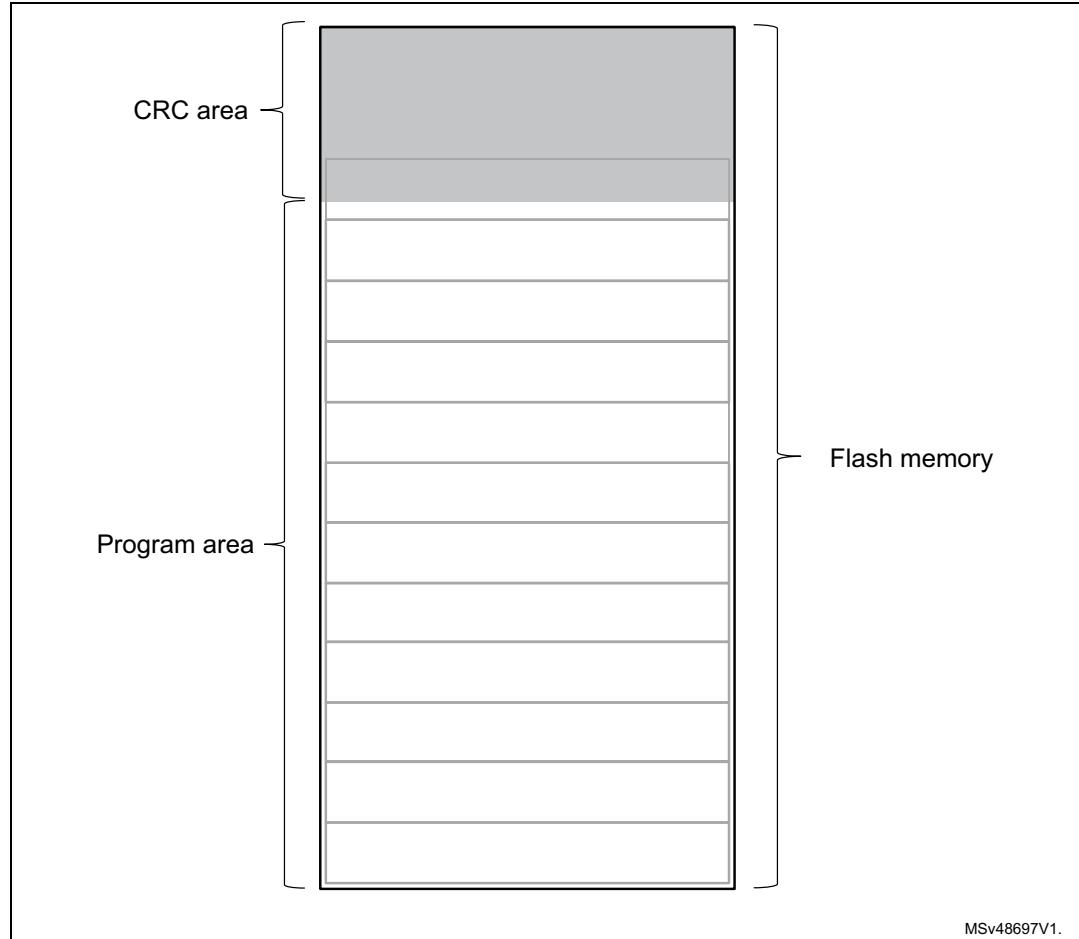

```
C:\>STM32_Programmer_CLI.exe -sl TestCRC.axf 0x8000000 0x8010000 0x400
STM32CubeProgrammer v0.4.0-RC1

Warning: The ELF file will be overwritten
CRCs area injected successfully
```

The Flash program memory is divided into slices, whose size is given as a parameter to the safety lib command as shown in the example above. For each slice a CRC value is computed and placed in the CRC area. The CRC area is placed at the end of the memory, as shown in [Figure 97](#).

**Figure 97. Flash memory mapping**

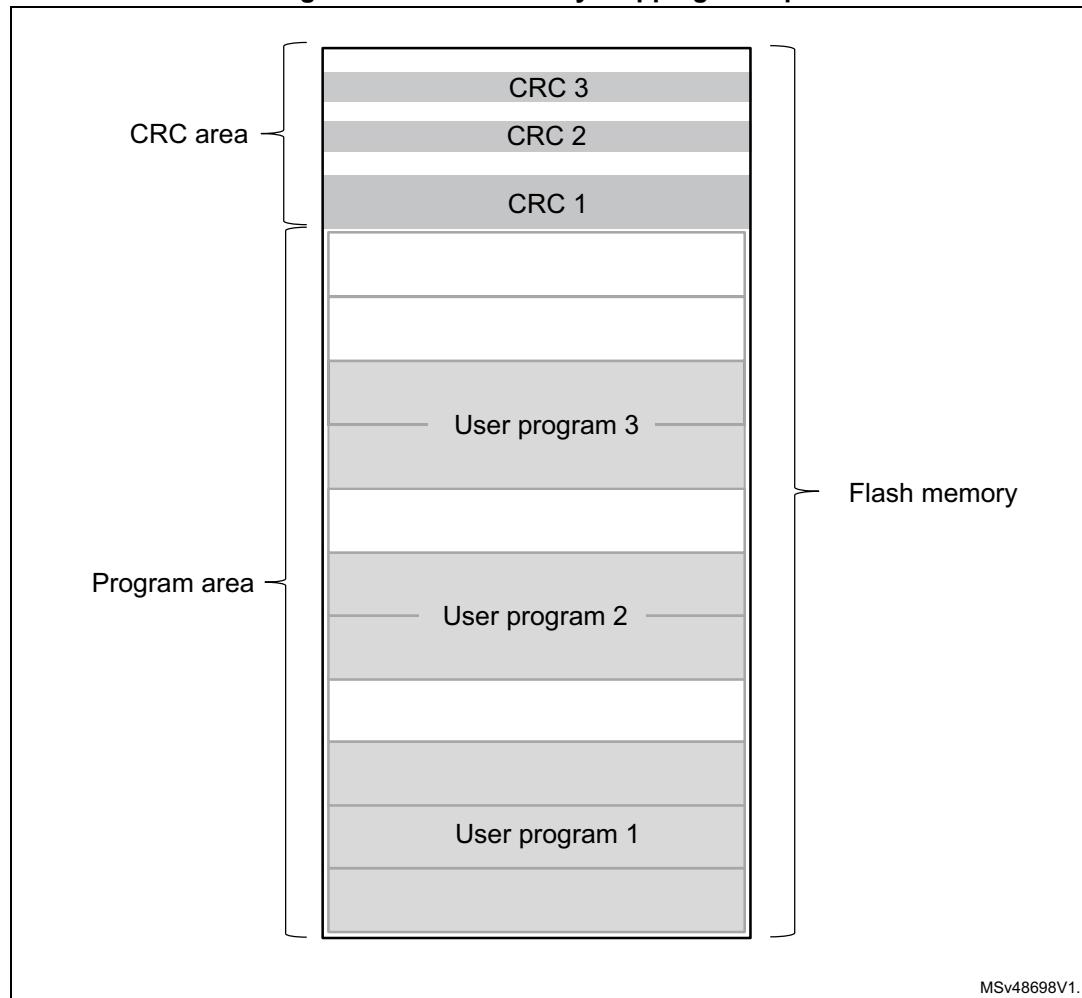

The address and size of the CRCs area are determined as follows:

$$\text{CRCs\_Area\_Size} = \text{Flash\_Size} / \text{Slice\_Size} * 4 \text{ bytes}$$

$$\text{CRCs\_Start\_Address} = \text{Flash\_End\_Address} - \text{CRCs\_Area\_Size}$$

The CRC values in the CRC area are placed according to the position(s) of the user program in the Flash memory, see [Figure 98](#).

**Figure 98. Flash memory mapping example**

The address of a CRCs region inside the CRCs area is calculated as:

$$@ = \text{CRCs\_Start\_Address} + \left( \frac{\text{UserProg\_Start\_Address} - \text{Flash\_Start\_Address}}{\text{Slice\_Size}} \cdot 4 \text{ bytes} \right)$$

### 3.2.19 Secure programming SFI specific commands

Secure firmware install (SFI) is a feature supporting secure firmware flashing, available on some STM32 devices. The firmware provider has the possibility to protect its internal firmware against any illegal access, and to control the number of devices that can be programmed.

The protected firmware installation can be performed using different communication channels, such as JTAG/SWD or bootloader interfaces (UART, SPI and USB).

For more details refer to *Secure programming using STM32CubeProgrammer* (AN5054), available on [www.st.com](http://www.st.com).

**-sfi, --sfi**

**Description:** Programs an sfi file

**Syntax:** `-sfi [<protocol=Ptype>] <.sfi file_path> [hsm=0|1]`  
`<lic_path|slot=slotID> [<licMod_path>|slot=slotID]`

|  |  |
|--|--|
| <code>[&lt;protocol=Ptype&gt;]</code>          | Protocol type to be used: static/live (only static protocol is supported so far), default: static.   |
| <code>&lt;file_path&gt;</code>                 | Path of sfi file to be programmed.   |
| <code>[hsm=0 1]</code>                         | Sets user option for HSM use value {0 (do not use HSM), 1 (use HSM)}, default: hsm=0.  |
| <code>&lt;lic_path slot=slotID&gt;</code>      | Path to the SFI license file (if hsm=0) or reader slot ID if HSM is used (hsm=1).  |
| <code>[&lt;licMod_path&gt; slot=slotID]</code> | List of the integrated SMI license files paths if HSM is not used (hsm=0) or readers slot IDs list if HSM is used (hsm=1).<br>Used only in combined case, the list order must correspond to modules integration order within the SFI file. |

**-rsse, --rsse**

**Description:** This command allows the user to select the root secure services extension library (RSSe). Mandatory for devices using RSSe to make secure firmware install (SFI). The RSSe binary file can be found in STM32CubeProgrammer bin/RSSe folder.

**Syntax:** `-rsse <file_path>`

`<file_path>` Path of RSSe file

**-a, --abort**

**Description:** This command allows the user to clean a not properly finished process. The currently ongoing operation stops and the system returns to idle state.

**Syntax:** `-a`

### 3.2.20 Secure programming SFIx specific commands

Secure firmware install (SFIx) is a feature supporting secure external firmware flashing, available on some STM32 devices with OTFDEC capability. The firmware provider has the

possibility to protect its external firmware/data against any illegal access, and to control the number of devices that can be programmed.

The SFIx secure programming can be carried out only with JTAG/SWD interface.

For more details refer to AN5054 *Secure programming using STM32CubeProgrammer*.

#### **-sfi, --sfi**

**Description:** Programs an sfix file

**Syntax:** `-sfi [<protocol=Ptype>] <.sfix file_path> [hsm=0|1]<lic_path|slot=slotID> [<licMod_path>|slot=slotID]`

|  |   |
|--|---|
| <code>[&lt;protocol=Ptype&gt;]</code>          | Protocol type to be used: static/live (only static protocol is supported so far), default: static.  |
| <code>&lt;file_path&gt;</code>                 | Path of sfi file to be programmed.  |
| <code>[hsm=0 1]</code>                         | Sets user option for HSM use value {0 (do not use HSM), 1 (use HSM)}, default: hsm=0.   |
| <code>&lt;lic_path slot=slotID&gt;</code>      | Path to the SFI license file (if hsm=0) or reader slot ID if HSM is used (hsm=1).   |
| <code>[&lt;licMod_path&gt; slot=slotID]</code> | List of the integrated SMI license file paths if HSM is not used (hsm=0) or readers slot IDs list if HSM is used (hsm=1).<br>Used only in combined case, the list order must correspond to modules integration order within the SFI file. |
| <b>-elbl --extload</b>                         | Selects a custom external memory-loader, only for the JTAG/SWD interfaces   |
| <code>&lt;file_path&gt;</code>                 | External memory-loader file path  |
| <b>-elbl --extloadbl</b>                       | Selects a custom external memory-loader for the bootloader interface  |
| <code>&lt;file_path&gt;</code>                 | External memory-loader file path  |

#### **-rsse, --rsse**

**Description:** This command allows the user to select the root secure services extension library (RSSe). Mandatory for devices using RSSe to make secure firmware install (SFI). The RSSe binary file can be found in STM32CubeProgrammer bin/RSSe folder.

**Syntax:** `-rsse <file_path>`

`<file_path>` Path of RSSe file

#### **-a, --abort**

**Description:** This command allows the user to clean a not properly finished process. The ongoing operation stops and the system returns to idle state.

**Syntax:** `-a`

**Note:** The ExternalLoader is different for SFx use case since some initializations are already done by RSS, and it is marked with –SFIX at the end of the External FlashLoader name.

### 3.2.21 HSM related commands

To control the number of devices that can be programmed ST offers a secure firmware flashing service based on HSM (hardware secure module) as a license generation tool to be deployed in the programming house.

Two HSM versions are available:

- HSMv1: static HSM, it allows the user to generate firmware licenses for STM32 secure programming of devices selected in advance.
- HSMv2: dynamic HSM, it is an updated version of the previous one, allows the generation of firmware licenses targeting STM32 secure programming of devices chosen via personalization data at the OEM site.

Before using the HSM, it must be programmed using Trusted Package Creator, this tool can program both versions with some specific input configurations, as detailed in UM2238.

For more details refer to AN5054 *Secure programming using STM32CubeProgrammer*.

#### **-hsmgetinfo**

**Description:** Reads the HSM available information

**Syntax:** **-hsmgetinfo [slot=<SlotID>]**

[**slot=<SlotID>**] Slot ID of the smart card reader

Default value: slot=1 (the PC integrated SC reader)

#### **-hsmgetcounter**

**Description:** Reads the current value of the license counter

**Syntax:** **-hsmgetcounter [slot=<SlotID>]**

[**slot=<SlotID>**] Slot ID of the smart card reader

Default value: slot=1 (the PC integrated SC reader)

#### **-hsmgetfwid**

**Description:** Reads the Firmware/Module identifier

**Syntax:** **-hsmgetfwid [slot=<SlotID>]**

[**slot=<SlotID>**] Slot ID of the smart card reader

Default value: slot=1 (the PC integrated SC reader)

#### **-hsmgetstatus**

**Description:** Reads the current card life-cycle state

**Syntax:** **-hsmgetstatus [slot=<SlotID>]**

**[slot=<SlotID>]** Slot ID of the smart card reader  
Default value: slot=1 (the PC integrated SC reader)

#### **-hsmgetlicense**

**Description:** Gets a license for the current chip if counter is not null

**Syntax:** **-hsmgetlicense <file\_path> [slot=<SlotID>] [protocol=<Ptype>]**

**<file\_path>** File path into where the received license is stored

**[slot=<SlotID>]** Slot ID of the smart card reader  
Default value: slot=1 (the PC integrated SC reader)

**[<protocol=Ptype>]** Protocol type to be used: static/live  
Only static protocol is supported so far  
Default value: static

#### **-hsmgetlicensefromcertifbin, -hsmglfcb**

**Description:** Gets a license for the current certificate binary file if counter is not null.

**Syntax:** **-hsmglfcb <certif\_file\_path.bin> <license\_file\_path.bin> [slot=<SlotID>] [protocol=<Ptype>]**

**<certif\_file\_path.bin>** File path from which the input certificate is read.

**<license\_file\_path.bin>** File path where the received license is stored

**[slot=<SlotID>]** Slot ID of the smart card reader.  
Default value: slot=1 (the PC integrated SC reader)

### **3.2.22 STM32WB specific commands**

#### **-antirollback**

**Description:** Perform the antirollback operation

**Syntax:** **-antirollback**

#### **-startfus**

**Description:** Start the FUS

**Syntax:** **-startfus**

#### **-getuid64**

**Description:** Read the device unique identifier (UID)

**Syntax:** **-getuid64**

#### **-fusgetstate**

**Description:** Read the FUS state

**Syntax:** **-fusgetstate**

**-fusopgetversion**

**Description:** Read the FUS Operator version

**Syntax:** **-fusgetversion**

**Note:** *FUS Operator version is not available via bootloader interfaces.*

**-fwdelete**

**Description:** Delete the BLE stack firmware

**Syntax:** **-fwdelete**

**-fwupgrade**

**Description:** Upgrade of BLE stack firmware or FUS firmware.

**Syntax:** **-fwupgrade <file\_path> <address> [firstinstall=0|1] [startstack=0|1] [-v]**

**<file\_path>** New firmware image file path

**<address>** Start address of download

**[firstinstall=0|1]** 1 if it is the first installation, otherwise 0  
Optional, default value **firstinstall=0**

**[-v]** Verify if the download operation is achieved successfully  
before starting the upgrade

**-startwirelessstack**

**Description:** Start the wireless stack

**Syntax:** **-startwirelessstack**

**-authkeyupdate**

**Description:** Authentication key update

**Syntax:** **-authkeyupdate <file\_path>**

**<file\_path>** Authentication key file path.

This is the public key generated by STM32TrustedPackageCreator  
when signing the firmware using **-sign** command.

**-authkeylock**

**Description:** Authentication key lock

Once locked, it is no longer possible to change it using **-authkeyupdate** command

**Syntax:** **-authkeylock**

**-wusrkey**

**Description:** Customer key storage

**Syntax:** `-wusrkey <file_path> <keytype=1|2|3>`

`<file.path>`: customer key in binary format

`<keytype=1|2|3>`: User key type values: 1 (simple), 2 (master) or 3 (encrypted)

#### **-startwirelessstack**

**Description:** Starts the wireless stack

**Syntax:** `-startwirelessstack`

**Note:** *These commands are available only through SWD, USB DFU and UART interfaces.*

**Note:** *Under Reset mode is mandatory.*

#### **Usage example for SWD interface**

- FUS upgrade:

```
STM32_Programmer_CLI.exe -c port=swd mode=UR -ob nSWboot0=0 nboot1=1  
nboot0=1 -fwupgrade stm32wb5x_FUS_fw.bin 0x080EC000 firstinstall=1
```

- Stack install:

```
STM32_Programmer_CLI.exe -c port=swd mode=UR -ob nSWboot0=0 nboot1=1  
nboot0=1 -fwupgrade stm32wb5x_BLE_Stack_fw.bin 0x080EC000
```

- User application install:

```
STM32_Programmer_CLI.exe -c port=swd mode=UR -d UserApplication.bin  
0x08000000 -v
```

**Note:** *-antirollback command is available starting from FUS v1.2.0.*

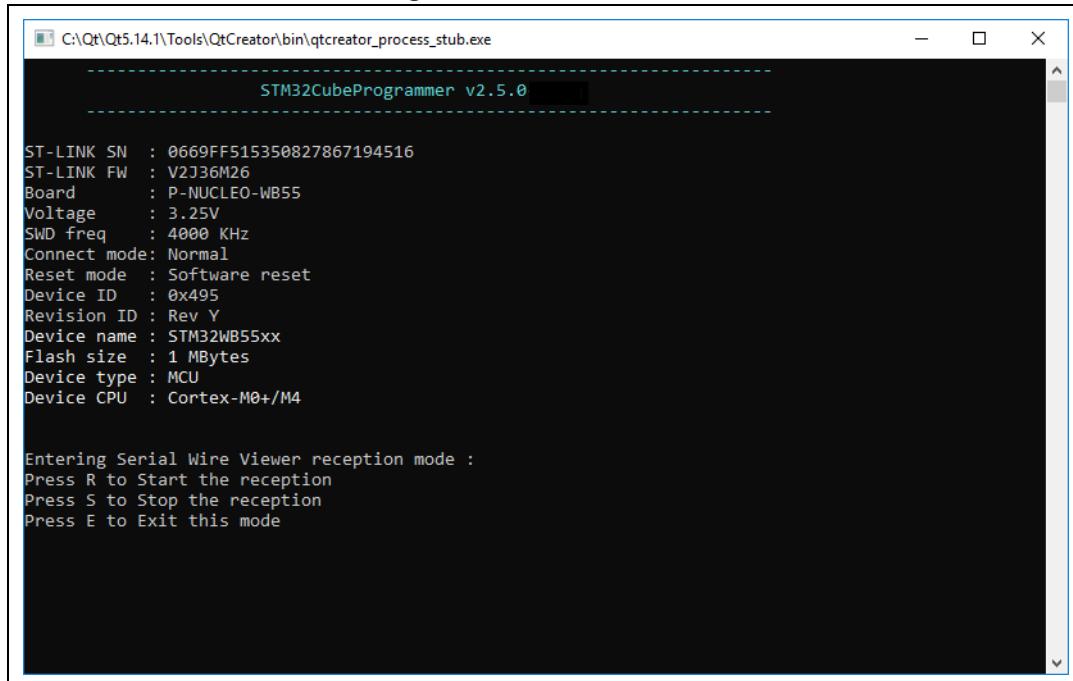

### **3.2.23 Serial wire viewer (SWV) command**

#### **-SWV**

**Description:** This command allows the user to access the serial wire viewer console mode, which displays the printf data sent from the target through SWO.

In this mode (see [Figure 99](#)) the user can start and stop the reception of the SWO data by pressing, respectively, the “R” and “S” buttons on the keyboard. The received SWO data are displayed in the console. Pressing the “E” button allows the user to exit the serial wire viewer console mode and terminate the reception session.

Figure 99. SWV command

**Syntax:** `swv <freq=<frequency>> <portnumber=0-32> [<file_Path.log>]`

`<freq=<frequency>>` System clock frequency in MHz.

`<portnumber=0-31|all>` ITM port number, values: 0-31, or "all" for all ports.

`[<file_Path.log>]` Path of the SWV log file (optional). If not specified default is:  
"\$USER\_HOME/STMicroelectronics/STM32Programmer  
/SWV\_Log/swv.log"

Example:

```
STM32_Programmer_CLI.exe -c port=swd -swv freq=32 portnumber=0
C:\Users\ST\swvLog\example.log
```

*Note:* The serial wire viewer is only available through SWD interface.

*Note:* Some SWV bytes can be lost during transfer due to ST-LINK hardware buffer size limitation.

### 3.2.24 Specific commands for STM32WL

Before performing the encrypted firmware installation, set the device in its default status, i.e. with security disabled (ESE = 0x0) and all the option bytes at their default values.

For this purpose STM32CubeProgrammer allows the user to perform these steps using two command lines:

1. **descurity:** allows the user to disable security.

Example: `STM32_Programmer_CLI.exe -c port=swd mode=hotplug -desecurity`

2. **setDefaultob:** this command allows the user to configure option bytes to their default values.

Example: `STM32_Programmer_CLI.exe -c port=swd mode=hotplug -setDefaultob`

After the execution of these commands go through a power OFF / power ON sequence. These two commands allow the user to unlock the board in case of inability to change option bytes using the usual method.

*Figure 100* and *Figure 101* show the results of these command lines.

**Figure 100. Disable security**

C:\Program Files\STMicroelectronics\STM32Cube\STM32CubeProgrammer\v2.6.0-A05\bin>
```

If the user locks the board and is unable to unlock it with these two commands, there are specific scripts to unlock it. These scripts are under “..../bin/STM32WLScripts”, they contain a command line using –wdbg option to write directly scripts in the OPTR register.

The folder STM32Scripts contains two files and the Readme.txt:

1. “SetRDPLevelCM0.bat” to unlock the board via Cortex M0+
2. “SetRDPLevelCM4.bat” to unlock the board via Cortex M4

**Note:** *If SFI command finishes with a fail, the STM32WL chip must be set in its default status using the disable security command line (-dsecurity), then the set default option byte command line (-setdefaultob).*

### 3.2.25 SigFox credential commands

These commands are supported only for STM32WL devices.

**-ssigfoxc**

**Description:** This command allows to user to save the chip certificate to a binary file.

**Syntax:** **-ssigfoxc <binary\_file\_path>**

Example: STM32\_Programmer\_CLI.exe -c port=swd -ssigfoxc “/local/user/chip\_certif.bin”

**Figure 102. Example of -ssigfoxc command**

```

ST-LINK SN   : 50FF6E067265575458302067

Device type  : MCU
Device CPU   : Cortex-M4

SigFox certificate File   : C:\test\sigfox.bin
Data read successfully
The SigFox certificate file is saved successfully: C:\test\sigfox.bin

```

**-wsigfoxc**

**Description:** This command allows to user to write the chip certificate at address 0x0803E500

**Syntax:** `-wsigfoxc <binary_file_path> <address>` [The address is optional, by default is 0x0803E500]

Example 1: STM32\_Programmer\_CLI.exe -c port=swd -wsigfoxc "/local/user/sigfox\_data.bin"0x0803E500

**Figure 103. Example (1) of -wsigfoxc command**

### 3.2.26 Register Viewer

**-regdump**

**Description:** Reads and dumps core and MCU registers

**Syntax:** `-regdump <file_path.log> [choice=<number>]`

`<file_path.log>` Log file path

`[choice=<number>]` Device number from the list of compatible devices (optional). This list is displayed if the command is performed without this optional argument.

Example: STM32\_Programmer\_CLI.exe -regdump C:\test\STM32F072.log

Figure 105. Read core and MCU registers

```
C:\Program Files (x86)\STMicroelectronics\STM32Cube\STM32CubeProgrammer\v2.7.0\bin>STM32_Programmer_CLI.exe -c port=swd mode=hotplug -regdump C:\test\STM32F072.log
STM32CubeProgrammer v2.7.0

```

### 3.2.27 Hard fault analyzer

To start the analysis (see [Section 2.13](#)), use a specific command line.

Syntax: **-hf**

The output trace contains different kinds of essential information to better understand the reason(s) that caused a particular fault.

An informative message “STM32CubeProgrammer Fault Analyzer” is displayed to indicate that the detection flow has started.

*Note:* Connection to target must be established before performing Fault Analyzer command.

#### Example

Using the same example as GUI mode (division by 0).

Command: **-c port=swd mode=hotplug -hf**

From the command line output, a Green message indicates a “Hard Fault Detected” and “The processor has executed a SDIV or UDIV instruction with a divisor of 0”.

Useful informations can be extracted:

- Faulty instruction address: 0x80002E4
- Faulty instruction called by a function located at this address: 0x800022D
- NVIC position: 0, Window Watchdog interrupt
- Execution mode: Handler
- Core registers capture.

Figure 106. Fault Analyzer CLI view when Hard Fault detected

```
STM32CubeProgrammer Fault Analyzer

Core Registers :

r ap 0 reg  0  0x48000000
r ap 0 reg  1  0x0000000020
r ap 0 reg  2  0x0000000020
r ap 0 reg  3  0x0000000020
r ap 0 reg  4  0x0000000006
r ap 0 reg  5  0x0000000000
r ap 0 reg  6  0x0000000000
r ap 0 reg  7  0x0000000000
r ap 0 reg  8  0x0000000000
r ap 0 reg  9  0x0000000000
r ap 0 reg 10  0x0000000000
r ap 0 reg 11  0x0000000000
r ap 0 reg 12  0x0000000000
r ap 0 SP   13  0x200003E0
r ap 0 LR   14  0xFFFFFFFFF9
r ap 0 PC   15  0x00000032E
r ap 0 XPSR 16  0x21000003
r ap 0 MSP   -  0x200003E0
r ap 0 PSP   -  0x0000000000
r ap 0 CR   20  0x0000000000

Execution Mode : Handler

Usage Fault detected in instruction located at 0x080002E4

NVIC position : 0

DIVBYZERO : The processor has executed a SDIV or UDIV instruction with a divisor of 0.

Hard Fault detected :

Faulty function called at this location 0x0800022D

Hard Fault State Register information :

FORCED : forced Hard Fault.

Exception return information :

Return to Thread mode, exception return uses non-floating-point
state from MSP and execution uses MSP after return.
```

### 3.2.28 RDP regression with password

Some STM32 products (e.g. those of the STM32U5 Series) offer the possibility to use an optional password-based RDP level regression, including RDP Level 2.

Detailed information about this hardware mechanism is available in reference manuals.

Password lock and unlock CLI commands are:

#### - lockRDP1

**Description:** Allows the user to lock the RDP regression from level 1 with a password.

**Syntax:** - lockRDP1 <Password first 32 bits> <Password second 32 bits>

**Example:**

```
STM32_Programmer_CLI -c port=swd mode=hotplug -lockRDP1 0x12345678
0xDEADBEEF
```

**- lockRDP2**

**Description:** This command allows the user to lock the RDP regression from level 2 with a password.

**Syntax:** - lockRDP2 <Password first 32 bits> <Password second 32 bits>

**Example:**

```
STM32_Programmer_CLI -c port=swd mode=hotplug - lockRDP2 0x12345678  
0xDEADBEEF
```

**- unlockRDP1**

**Description:** This command allows to unlock the RDP regression from level 1 with a password.

**Syntax:** - unlockRDP1 <Password first 32 bits> <Password second 32 bits>

**Example:**

```
STM32_Programmer_CLI -c port=swd mode=hotplug -unlockRDP1  
0x12345678 0xDEADBEEF
```

**- unlockRDP2**

**Description:** This command allows the user to unlock the RDP regression from level 2 with a password.

**Syntax:** - unlockRDP2 <Password first 32 bits> <Password second 32 bits>

**Example:**

```
STM32_Programmer_CLI -c port=swd mode=hotplug - unlockRDP2  
0x12345678 0xDEADBEEF
```

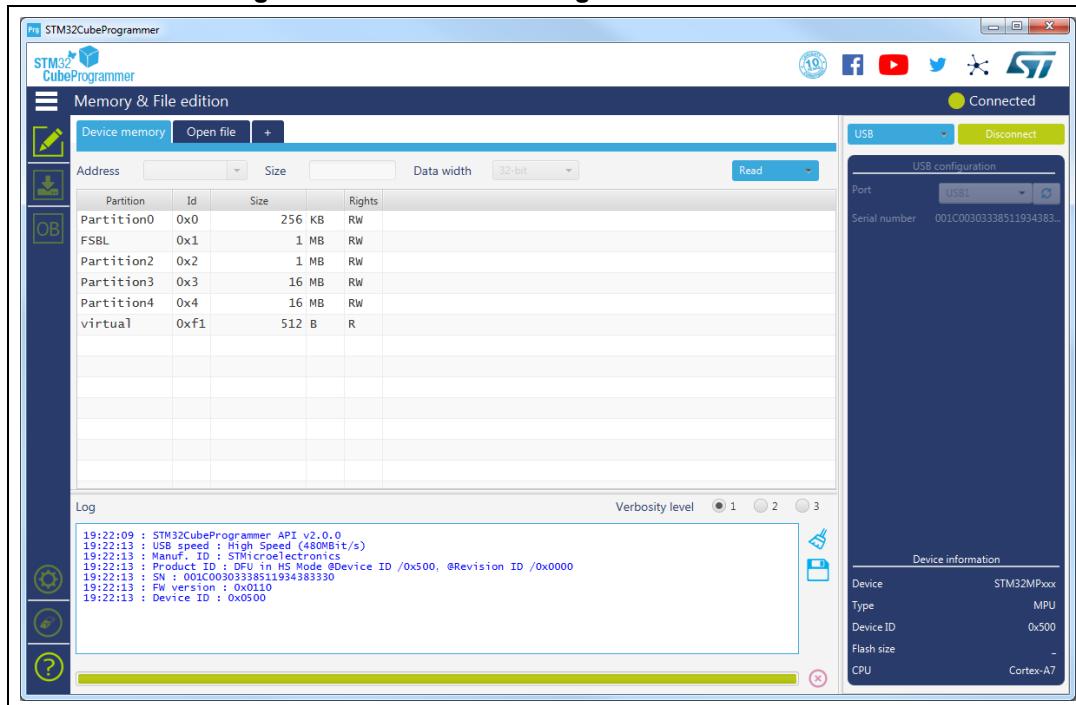

**Note:** After unlocking the RDP, the user must perform an RDP regression, as the listed commands do not include the RDP regression operation.

**Note:** To remove RDP regression with password, the user must use the Lock command and a password with value 0x00000000 0x00000000, such as STM32\_Programmer\_CLI -c port=swd mode=hotplug -lockRDP1 0x00000000 0x00000000

## 4 STM32CubeProgrammer user interface for MPUs

### 4.1 Main window

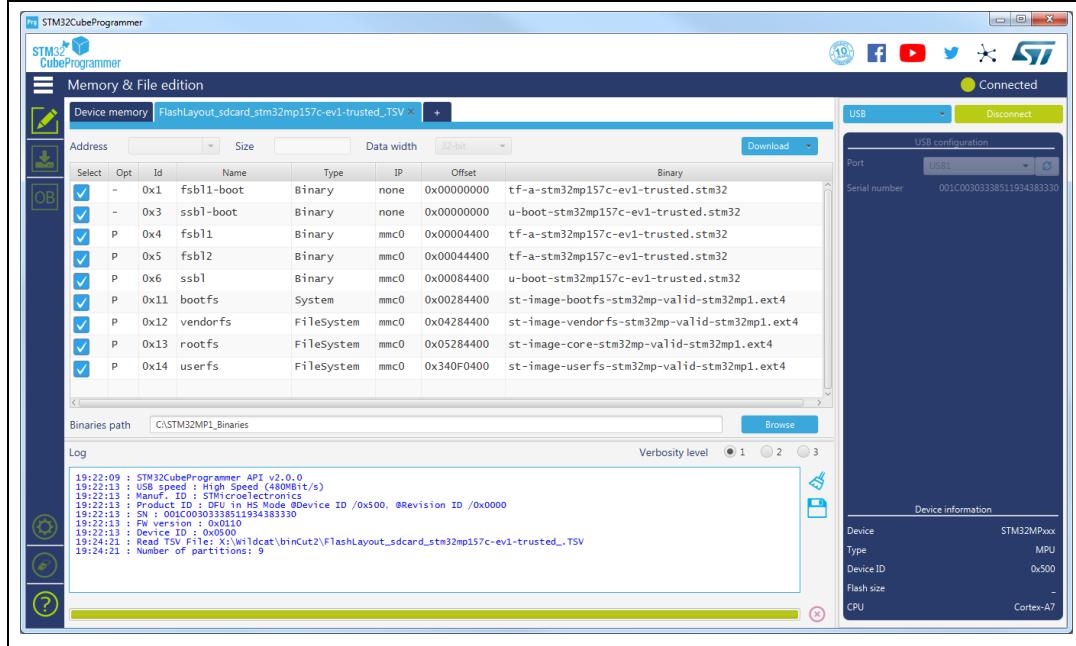

Figure 107. STM32CubeProgrammer main window

The main window allows the user to select the interface used to connect to STM32MP1 BootROM, possible interfaces are USB-DFU and UART (programming through stlink interface is not possible with STM32MP1 Series). Once connected (using connect button) available partitions are displayed, the user is able to open a TSV file for programming.

## 4.2 Programming windows

Figure 108. TSV programming window

To perform TSV files programming the user must perform the following operations:

- Open a TSV file by using “Open file” tab, if TSV file format is correct then TSV content is displayed in the main window. TSV Files are available in STM32MP1 Linux distributions, refer to STM32MP1 wiki for more details.
- Specify binaries path in “Binaries path” text box.
- Select the list of partitions to be programmed in “select” column, by default all partitions are selected.
- Launch download using “Download” button.

For more details concerning flashing operations refer to AN5275, available on [www.st.com](http://www.st.com).

## 5 STM32CubeProgrammer CLI for MPUs

### 5.1 Available commands for STM32MP1

This section details the commands supported on STM32MP1 devices.

#### 5.1.1 Connect command

##### -c, --connect

**Description:** Establishes the connection to the device. This command allows the host to open the chosen device port (UART/USB)

**Syntax:** -c **port=<Portname>** [noinit=<noinit\_bit>] [br=<baudrate>]  
[P=<Parity>] [db=<data\_bits>] [sb=<stop\_bits>] [fc=<flowControl>]

|                                    |   |
|------------------------------------|---|
| <b>port=&lt;Portname&gt;</b>       | Interface identifier:<br>– ex COMx (for Windows)<br>– /dev/ttysX (for Linux)<br>– usbx for USB interface                                      |
| <b>[noinit=&lt;noinit_bit&gt;]</b> | Sets No Init bits, value in {0,1}, default 0.<br><br>Noinit=1 can be used if a previous connection is active (no need to send 0X7F).          |
| <b>[br=&lt;baudrate&gt;]</b>       | Baudrate, (e.g. 9600, 115200), default 115200.  |
| <b>[P=&lt;Parity&gt;]</b>          | Parity bit, value in (EVEN, NONE, ODD), default EVEN.   |
| <b>[db=&lt;data_bits&gt;]</b>      | Data bit, value in (6, 7, 8), default 8.  |
| <b>[sb=&lt;stop_bits&gt;]</b>      | Stop bit, value in (1, 1.5, 2), default 1.  |
| <b>[fc=&lt;flowControl&gt;]</b>    | Flow control, value in (OFF, Software, Hardware). Software and Hardware flow controls are not yet supported for STM32MP1 Series, default OFF. |

##### Example

Using UART:

```
./STM32_Programmer.sh -c port=/dev/ttys0 p=none
```

The result of this example is shown [Figure 109](#).

**Figure 109. Connect operation using RS232**

```

-----  

STM32CubeProgrammer v1.0.2  

-----  

Serial Port COM1 is successfully opened.  

Port configuration: parity = none, baudrate = 115200, data-bit = 8,  

stop-bit = 1.0, flow-control = off  

Activating device: OK  

Chip ID: 0x500  

BootLoader protocol version: 4.0  

Device name: STM32MPxxx  

Device type: MPU  

Device CPU : Cortex_A7

```

**Note:** When using the USB interface, all the configuration parameters (such as baudrate, parity, data-bits, frequency, index) are ignored.

**Note:** To connect using UART interface, the port configuration (baudrate, parity, data-bits, stop-bits and flow-control) must have a valid combination.

### 5.1.2 GetPhase command

**-p, --phaseID**

**Description:** This command allows the user to know the next partition ID to be executed.

**Syntax:** `--phaseID`

**Example**

```
./STM32_Programmer.sh -c port=/dev/ttyS0 p=none br=115200 --phaseID
```

### 5.1.3 Download command

**-w, --write, -d, --download**

**Description:** Downloads the content of the specified binary file into a specific partition in the Flash or SRAM memories.

**Syntax:** `-w <file_path> [partitionID]`

**[file\_path]** File path to be downloaded (bin, stm32, vfat, jffs2, ubi, ext2/3/4 and img file extensions).

**[partition\_ID]** Partition ID to be downloaded.

**Example**

```
./STM32_Programmer.sh -c port=/dev/ttyS0 p=none -d atf.stm32 0x01
```

This command allows the user to download the atf binary file at Atf partition (partition ID: 0x01).

The result of this example is shown in [Figure 110](#).

Figure 110. Download operation

```

Memory Programming ...
File          : atf.stm32
Size         : 225216 Bytes
Partition ID : 0x01

Download in Progress: 100%

File download complete
Time elapsed during the download operation is: 00:00:22.690

```

**Note:** For U-boot with USB interface, to program the non volatile memory (NVM) with the loaded partition using download command, the user must execute a start command with the partition ID. Besides, to execute an application loaded in the NVM, it is needed to specify the start address.

**Example:** Download and manifestation on alternate 0x1

```
./STM32_Programmer.sh -c port=usb0 -w atf.stm32 0x1 -s 0x01
```

#### 5.1.4 Flashing service

**Description:** The embedded flashing service aims to load sequentially the partitions requested by the bootloader. To do this STM32CubeProgrammer needs the TSV file, which contains information about the requested partitions to be loaded.

STM32CubeProgrammer downloads and starts the requested partition ID until the end of operation (phaseID = 0xFE).

**Syntax:** `-w < tsv file_path >`

`<tsv file_path>` Path of the tsv file to be downloaded.

Figure 111. TSV file format

| #Opt | Id   | Name       | Type       | IP   | Offset     | Binary   |
|------|------|------------|------------|------|------------|--|
| -    | 0x01 | fsbl1-boot | Binary     | none | 0x0        | tf-a-stm32mp157c-dk2-trusted.stm32                       |
| -    | 0x03 | ssbl-boot  | Binary     | none | 0x0        | u-boot-stm32mp157c-dk2-trusted.stm32                     |
| P    | 0x04 | fsbl1      | Binary     | mmc0 | 0x00004400 | tf-a-stm32mp157c-dk2-trusted.stm32                       |
| P    | 0x05 | fsbl2      | Binary     | mmc0 | 0x00044400 | tf-a-stm32mp157c-dk2-trusted.stm32                       |
| P    | 0x06 | ssbl       | Binary     | mmc0 | 0x00084400 | u-boot-stm32mp157c-dk2-trusted.stm32                     |
| P    | 0x21 | bootfs     | System     | mmc0 | 0x00284400 | st-image-bootfs-openstlinux-weston-extra-stm32mp1.ext4   |
| P    | 0x22 | vendorfs   | FileSystem | mmc0 | 0x04284400 | st-image-vendorfs-openstlinux-weston-extra-stm32mp1.ext4 |
| P    | 0x23 | rootfs     | FileSystem | mmc0 | 0x05284400 | st-image-weston-openstlinux-weston-extra-stm32mp1.ext4   |
| P    | 0x24 | usersfs    | FileSystem | mmc0 | 0x340F0400 | st-image-usersfs-openstlinux-weston-extra-stm32mp1.ext4  |

**Example**

```
./STM32_Programmer.sh -c port=/dev/ttyS0 p=none br=115200 -d
Flashlayout.tsv
```

**Note:** While programming the Flashlayout.tsv file, U-boot can spend a long time to start correctly, for this reason configure the timeout value by using the timeout command (-tm <timeout>).

#### 5.1.5 Start command

`-g, --go, -s, --start`

**Description:** This command allows executing the device memory starting from the specified address.

**Syntax:** `--start [start_address/Partition_ID]`

**[start\_address]** Start address of application to be executed. If not specified with STM32MP and UART interface, last loaded partition is started.

**[Partition\_ID]** This parameter is needed only with STM32MP devices. It specifies the partition ID to be started.

#### Example

```
./STM32_Programmer.sh --connect port=/dev/ttyS0 p=none br=115200 --start 0x03
```

This command allows the user to run the code specified at partition 0x03.

**Note:** For U-boot with USB interface, to program the NVM with the loaded partition using download command, you need to execute a start command with the partition ID. To execute an application loaded in the NVM, you need to specify the start address.

**Example 1:** Download and manifestation on alternate 0x1

```
./STM32_Programmer.sh -c port=usb0 -w atf.stm32 0x01 -s 0x01
```

**Example 2:** Execute code at a specific address

```
./STM32_Programmer.sh -c port=usb0 -s 0xC0000000
```

## 5.1.6 Read partition command

### -rp, --readPart

**Description:** Reads and uploads the specified partition content into a specified binary file starting from an offset address. This command is supported only by U-boot.

**Syntax:** `--readPart <partition_ID> [offset_address] <size> <file_path>`

**<partition\_ID>** Partition ID

**[offset\_address]** Offset address of read

**<size>** Size of memory content to be read

**<file\_path>** Binary file path to upload the memory content

#### Example:

```
./STM32_Programmer.sh -c port=/dev/ttyS0 p=none br=115200 -rp 0x01 0x200 0x1000 readPart1.bin
```

This command allows the user to read 0x1000 bytes from the sebl1 partition at offset address 0x200 and to upload its content to a binary file “readPart1.bin”

## 5.1.7 List command

### -l, -list

**Description:** This command lists all available communication interfaces UART and USB.

**Syntax:** `-l, --list <interface_name>`

**<uart/usb>**: UART or USB interface

**Example:**

```
./STM32_Programmer.sh -list uart
```

### 5.1.8 QuietMode command

**-q, --quietMode**

**Description:** This command disables the progress bar display during Download and Read partition commands.

**Syntax:** `-q, --quietMode`

**Example:**

```
./STM32_Programmer.sh -c port=/dev/ttyS0 p=none br=115200 --quietMode -w  
binaryPath.bin 0x01
```

### 5.1.9 Verbosity command

**-vb, --verbosity**

**Description:** This command allows the user to display more messages, to be more verbose.

**Syntax:** `-vb <level>`

`<level>` : Verbosity level, value in {1, 2, 3} default value vb=1

**Example:**

```
./STM32_Programmer.sh -c port=/dev/ttyS0 p=none br=115200 -vb 3
```

### 5.1.10 Log command

**-log, --log**

**Description:** This traceability command allows the user to store the whole traffic (with maximum verbosity level) into log file.

**Syntax:** `-log [filePath.log]`

`[filePath.log]` : path of log file (default is \$HOME/.STM32CubeProgrammer/trace.log)

**Example:**

```
./STM32_Programmer.sh -c port=/dev/ttyS0 p=none br=115200 -log trace.log
```

This command generates a log file “trace.log” containing verbose messages (see an example in [Figure 112](#)).

**Figure 112. Log file content**

```
16:41:19:345
Log output file: trace.log
16:41:19:368 Serial Port /dev/ttyS0 is successfully opened.
16:41:19:368 Port configuration: parity = none, baudrate = 115200, data-bit = 8,
16:41:19:368 | stop-bit = 1.0, flow-control = off
16:41:19:368 Sending init command:
16:41:19:368 byte 0x7F sent successfully to target
16:41:19:369 Received response from target: 0x79
16:41:19:369 Activating device: OK
16:41:19:369 Sending GetID command and its XOR:
16:41:19:369 byte 0x02 sent successfully to target
16:41:19:369 byte 0xFD sent successfully to target
16:41:19:370 Received response from target: 0x79
16:41:19:370 Received response from target: 0x01050079
16:41:19:370 Chip ID: 0x500
16:41:19:370 Sending Get command and its XOR:
16:41:19:370 byte 0x00 sent successfully to target
16:41:19:370 byte 0xFF sent successfully to target
16:41:19:371 Received response from target: 0x79
16:41:19:371 Received response from target: 0x07
16:41:19:371 Received response from target: 0x07310001020311213179
16:41:19:371 BootLoader version: 3.1
```

### 5.1.11 OTP programming

**Description:** These commands allow the user to program the OTP from a host computer. The OTP programming commands functionalities, such as downloading or uploading a full OTP image and modifying an OTP value or properties, are explained below.

**Note:** *The following commands are not supported in JTAG/SWD debug port connection mode.*

- Loading shadow registers values to the tool:  
For load operation, the host requests the OTP partition data and the platform replies with the structure described on  
[https://wiki.st.com/stm32mpu/index.php/STM32CubeProgrammer OTP\\_management](https://wiki.st.com/stm32mpu/index.php/STM32CubeProgrammer OTP_management).
- Writing the modified shadow registers to the target:  
This operation is executed by performing the following sequence:
  - a) The user types in the value and the status of each chosen OTP shadow register.
  - b) The tool updates the OTP structure with the newly given OTP shadow registers values and status.
  - c) The tool proceeds with sending the updated structure, with bit0 in the “Write/read conf” field set to 0 (“Write/read conf” is word number 7 in the OTP structure).
  - d) Once the structure is sent, the shadow register values are reloaded to update the OTP structure in the tool.
- Programming the OTP with the modified shadow registers values:  
once the user updates the OTP values and the OTP structure is refreshed, the host sends the OTP structure with bit0 in the “Write/read conf” field (word number 7 in the OTP structure) set to 1.
- Reloading the OTP value to the shadow registers:  
once the OTP words are successfully programmed, the host uploads the OTP structure in order to update the OTP shadow registers. This operation allows the host to verify the status of the last SAFMEM programming via bit4 in the “Status” field.
- BSEC control register programming:  
once the user updates the values of the given BSEC control register (Configuration, Debug configuration, Feature configuration and General lock configuration) the host updates the OTP structure and sends it to the device with bit0 in the “Write/read conf” field set to 0.
- OTP programming CLI:  
the user is given a set of commands to perform a chosen sequence of operations on the OTP partition. Each one of these commands is described below.

### 5.1.12 Programming SAFMEM command

**Description:** This command allows the user to program SAFMEM memory by modifying the OTP words.

**Syntax:** `-otp program [wordID=(value)] [value=(value)] [sha_rsl=(value)] [sha_wsl=(value)] [sl=(value)] [pl=(value)]`

- [wordID=(value)]** This field contains the shadow register number (between 0 and 95). Value must be written in hexadecimal form.
- [value=(value)]** Loads value into the chosen OTP shadow register. Value must be written in hexadecimal form.

- [**sha\_rs1=(value)**] Loads value into the corresponding shadow read sticky lock bit.  
Value can be either 0 or 1.
- [**sha\_ws1=(value)**] Loads value into the corresponding shadow write sticky lock bit.  
Value can be either 0 or 1.
- [**sl=(value)**] Loads value into the corresponding programming sticky lock bit.  
Value can be either 0 or 1.
- [**pl=(value)**] Loads value into the corresponding programming permanent lock bit. Value can be either 0 or 1.

#### Example

```
./STM32_Programmer.sh --connect port=usb1 -otp program wordID=0x00  
value=0x3f sl=1 wordID=0x08 value=0x18
```

### 5.1.13 Detach command

**Description:** This command allows the user to send detach command to USB DFU.

**Syntax:** -detach

### 5.1.14 GetCertif command

**Description:** This command allows the user to read the chip certificate.

**Syntax:** -gc certification.bin

### 5.1.15 Write blob command

**Description:** This command allows the user to send the blob (secrets and license).

**Syntax:** -wb blob.bin

### 5.1.16 Display command

**Description:** This command allows the user to display all or parts of the OTP structure.

**Syntax:** -otp displ [upper] [lower] [ctrl]

[**upper**] Option to display the loaded upper OTP shadow registers values and status.

[**lower**] Option to display the loaded lower OTP shadow registers values and status.

[**ctrl**] Option to display the loaded BSEC control registers.

#### Example

```
./STM32_Programmer.sh --connect port=usb1 -otp displ
```

## 5.2 Secure programming SSP specific commands

Secure secret provisioning (SSP) is a feature supporting secure secret flashing procedure, available on STM32 MPU devices. STM32MP1 Series supports protection mechanisms allowing the user to protect critical operations (such as cryptography algorithms) and critical data (such as secret keys) against unexpected accesses.

This section gives an overview of the STM32 SSP command with its associated tools ecosystem and explains how to use it to protect OEM secrets during the CM product manufacturing stage.

For more details refer to AN5054 *Secure programming using STM32CubeProgrammer*.

STM32CubeProgrammer exports a simple SSP command with some options to perform the SSP programming flow.

### **-ssp, --ssp**

**Description:** Program an SSP file

**Syntax:** `-ssp <ssp_file_path> <ssp-fw-path> <hsm=0|1>`  
`<license_path|slot=slotID>`

|   |  |
|---|--|
| <code>&lt;ssp_file_path&gt;</code>            | SSP file path to be programmed, bin or ssp extensions.   |
| <code>&lt;ssp-fw-path&gt;</code>              | SSP signed firmware path.  |
| <code>&lt;hsm=0 1&gt;</code>                  | Set user option for HSM use (do not use / use HSM).<br>Default value: hsm=0.   |
| <code>&lt;license_path slot=slotID&gt;</code> | <ul style="list-style-type: none"><li>• Path to the license file (if hsm=0)</li><li>• Reader slot ID if HSM is used (if hsm=1)</li></ul> |

Example using USB DFU bootloader interface:

```
STM32_Programmer_CLI.exe -c port=usb1 -ssp "out.ssp" "tf-a-ssp-
stm32mp157f-dk2-trusted.stm32" hsm=1 slot=1
```

**Note:** *All SSP traces are shown on the output console.*

**Figure 113. SSP successfully installed**

```
Requesting Chip Certificate...
Get Certificate done successfully
requesting license for the current STM32 device
Init Communication ...
ldm_LoadModule(): loading module "stlibp11_SAM.dll" ...
ldm_LoadModule(WIN32): OK loading library "stlibp11_SAM.dll": 0x62000000 ...
C_GetFunctionList() returned 0x00000000, g_pFunctionList=0x62062FD8
P11 lib initialization Success!

Opening session with slot ID 1...
Succeed to Open session with reader slot ID 1
Succeed to generate license for the current STM32 device
Closing session with reader slot ID 1...
Session closed with reader slot ID 1
Closing communication with HSM...
Communication closed with HSM
Succeed to get License for Firmware from HSM slot ID 1
Starting Firmware Install operation...
Writing blob

Blob successfully written
Start operation achieved successfully
Send detach command
Detach command executed
SSP file out.ssp Install Operation Success
```

If there is any faulty input the SSP process is aborted, and an error message is displayed to indicate the root cause of the issue.

## 6 STM32CubeProgrammer C++ API

In addition to the graphical user interface and to the command line interface STM32CubeProgrammer offers a C++ API that can be used to develop your application and benefit of the wide range of features to program the memories embedded in STM32 microcontrollers, either over the debug interface or the bootloader interface (USB DFU, UART, I<sup>2</sup>C, SPI and CAN).

For more information about the C++ API, read the help file provided within the STM32CubeProgrammer package under API\doc folder.

## 7 Revision history

**Table 2. Document revision history**

| Date        | Revision | Changes  |
|-------------|----------|--|
| 15-Dec-2017 | 1        | Initial release.   |
| 02-Aug-2018 | 2        | <p>Updated:</p> <ul style="list-style-type: none"> <li>– <a href="#">Section 1.1: System requirements</a></li> <li>– <a href="#">Section 1.2.3: macOS install</a></li> <li>– <a href="#">Section 1.2.4: DFU driver</a></li> </ul> <p>Added:</p> <ul style="list-style-type: none"> <li>– <a href="#">Section 3.2.8: Debug commands</a></li> <li>– <a href="#">Figure 1: macOS “Allow applications downloaded from:” tab</a></li> <li>– <a href="#">Figure 2: Deleting the old driver software</a></li> </ul>   |
| 12-Sep-2018 | 3        | <p>Added SPI, CAN and I2C settings on cover page and in <a href="#">Section 2.1.4: Target configuration panel</a>.</p> <p>Updated:</p> <ul style="list-style-type: none"> <li>– <a href="#">Figure 6: ST-LINK configuration panel</a></li> <li>– <a href="#">Figure 81: STM32CubeProgrammer: available commands</a>.</li> <li>– <a href="#">Figure 86: Connect operation using SWD debug port</a></li> </ul> <p>Replaced <a href="#">Section 3.2.1: Connect command</a>.</p>   |
| 16-Nov-2018 | 4        | <p>Updated <a href="#">Section 2.1.4: Target configuration panel</a>, <a href="#">Section 2.2.1: Reading and displaying target memory</a>, <a href="#">Section 2.2.2: Reading and displaying a file</a> and <a href="#">Section 2.3.2: External Flash memory programming</a>.</p> <p>Updated <a href="#">Figure 4: STM32CubeProgrammer main window</a>, <a href="#">Figure 5: Expanded main menu</a>, <a href="#">Figure 6: ST-LINK configuration panel</a>, <a href="#">Figure 7: UART configuration panel</a>, <a href="#">Figure 8: USB configuration panel</a>, <a href="#">Figure 9: Target information panel</a>, <a href="#">Figure 10: SPI configuration panel</a>, <a href="#">Figure 11: CAN configuration panel</a>, <a href="#">Figure 12: I2C configuration panel</a>, <a href="#">Figure 13: Memory and file edition: Device memory tab</a>, <a href="#">Figure 15: Memory and file edition: File display</a>, <a href="#">Figure 16: Flash memory programming and erasing (internal memory)</a> and <a href="#">Figure 17: Flash memory programming (external memory)</a>.</p> <p>Minor text edits across the whole document.</p> |
| 03-Jan-2019 | 5        | <p>Updated <a href="#">Section 1.2.4: DFU driver</a>.</p> <p>Added <a href="#">Section 3.2.19: Secure programming SFI specific commands</a>, <a href="#">Section 3.2.21: HSM related commands</a> and <a href="#">Section 6: STM32CubeProgrammer C++ API</a>.</p> <p>Minor text edits across the whole document.</p>   |
| 04-Mar-2019 | 6        | <p>Updated <a href="#">Introduction</a> and <a href="#">Section 1: Getting started</a>.</p> <p>Updated title of <a href="#">Section 2: STM32CubeProgrammer user interface for MCUs</a> and of <a href="#">Section 3: STM32CubeProgrammer command line interface (CLI) for MCUs</a>.</p> <p>Added <a href="#">Section 2.5: Automatic mode</a>, <a href="#">Section 2.6: STM32WB OTA programming</a>, <a href="#">Section 4: STM32CubeProgrammer user interface for MPUs</a>, <a href="#">Section 5: STM32CubeProgrammer CLI for MPUs</a> and their subsections.</p>   |
